Introduction

The Town of Salem hired Vanasse Hangen Brustlin, Inc (VHB) in the spring of 2017 to update the Town's pavement management system by performing a Town-wide pavement condition inventory and evaluation, updating the Town's pavement management software to a web-based platform, and performing road network analysis. The primary goals of the project were to assess the current status of the Town's road network, assist with prioritizing pavement maintenance and rehabilitation needs, and to analyze the results of potential funding scenarios.

The following report describes the relevant concepts of pavement management practice, the steps undergone by VHB through the course of the project, a summary of the pavement conditions found in the Town, and the budget analysis performed by VHB.

In addition to the results presented in this report; at the conclusion of this project, the Town will also have a GIS integrated pavement management system which will allow it to track future condition of its pavements, maintain a live database of the pavement management information, and allow the Town to continue to analyze funding levels and produce road program candidate project lists..

What is Pavement Management?

We define pavement management as the practice of planning for pavement maintenance and rehabilitation with the goal of maximizing the value and life of a pavement network. This is otherwise known as, "**Getting the Biggest Bang for Your Buck.**"

To accomplish this, a community needs to have several repair techniques in its arsenal and the knowledge of when to apply them. This is where pavement management comes into play. With a comprehensive database of road conditions, the pavement management software can model when to perform which repairs on a road network. Of course, engineering judgment is required to finalize any list of street repairs, as no computer model can take every variable analyzed in making a repair decision into account. The computer system is a great springboard to help a community start its repair program for each year and is an excellent method of storing the repair data.

Below is a model of how a street's pavement deteriorates over time. Interpreting the curve, a street starts out in excellent condition when it is newly constructed. Midway through its life, a low-cost repair such as crack seal and full depth patch will cost approximately a dollar per square yard. It takes only a few years for the window of opportunity to perform this low-cost maintenance to pass after which the road would need an overlay costing \$11- \$17 per square yard. By performing timely maintenance, road conditions can be improved today thereby extending the life of the road.

This report describes the steps taken in this project, the results of the field evaluations, and compares the results of some potential roadway funding scenarios.

The major sections of this report are:

- Pavement Management Methodology
- Current Pavement Conditions
- Funding Scenarios
- Concluding Remarks

Pavement Management Methodology

VHB developed a pavement management database composed of a roadway pavement inventory and condition evaluation for all of Salem's Town accepted roadways. The complete process of identifying the Town road network, evaluating pavement conditions, configuring the database for analysis purposes and finally, the analysis of future funding scenarios is described below. These steps were performed prior to the study of funding scenarios.

Network Identification

Network Identification builds an inventory of streets that describe the municipality's complete roadway network. The direction of travel, street length, width, ownership, classification, zone and pavement type are among the items identified at this initial phase in the pavement management process. This integral step ensures the streets surveyed are the definitive set to be analyzed.

Part of the network identification process included correlating the previously used functional classification of roadways with the classification system currently used by

the Town. Arterial and Collector road designations were updated to match the Town's "Operational" road network.

Pavement Management Section Identification

Once the Network Identification is complete, the field work begins. Each street contains one or more pavement management sections. A pavement management section defines the limits of previous construction or maintenance activities within each street. Sections are defined by having the same width, typical distresses, functional class, etc. The goal is to set up homogenous areas of pavement to aid in assigning the appropriate repair. A street may be one section, or it may be comprised of several pavement management sections, depending on its construction history.

Surface Distress Assessment

For each pavement management section, the severity and extent of nine major pavement distresses are recorded, and then entered into a weighted formula to arrive at a Pavement Condition Index (PCI). The distresses are categorized as base related or surface related distresses. Base related distresses indicate that the pavement structure is inadequate for the existing traffic load and soil conditions. Streets that show significant base related distresses may need to have the pavement structure strengthened with either thicker or stronger base or pavement materials. Surface related distresses are caused by age and weathering of the pavement. Streets that have predominantly surface related distresses are excellent candidates for maintenance sealing to inhibit further pavement oxidization (the main effect of aging). Streets with more of the base related distresses will most likely need some full depth patching, structural overlays or reclamation/reconstruction.

The four base related distresses are:

- potholing or non-utility patching
- alligator cracking
- distortion
- rutting

The five surface related distresses are:

- block cracking
- transverse or longitudinal cracking
- bleeding or polished aggregate
- surface wear or raveling
- shoving, slippage or corrugation

The RoadManager pavement distress rating system, described above, and PCI formula shown below, were developed by Vanasse Hangen Brustlin, Inc. specifically to allow the efficient rating of the distresses and conditions found on New England roadways, and is used by over 100 municipalities throughout the region.

PCI Defined

A PCI was generated for each inventoried pavement management section in Salem using the surface distress data collected by VHB. PCI is measured on a scale of zero to one hundred, with one hundred representing a pavement in perfect condition and zero describing a road in impassable condition. Each type of observed pavement distress is assigned a deduct value based on the type, severity and extent of the

distress. A weighted sum of the deduct points is subtracted from the perfect “one hundred” road in order to generate a PCI for each pavement management section. In general, base related (pavement foundation) distresses are weighted more heavily than surface related distresses. For example, if 15% of a road section had medium severity “Alligator Cracking” it would receive a deduct of 40 points. Whereas the same area of “Block Cracking” would only receive a deduct of 15 points. The actual PCI calculation follows:

$$\text{PCI} = 100 - (\text{Highest Deduct Value}) - (25\% \text{ of remaining base related deduct values}) - (10\% \text{ of remaining surface related deduct values})$$

The Five Treatment Bands

The pavement management system uses broad ranges to group the individual repair types into five major treatment bands. Treatment bands are a useful tool to summarize data on a Town-wide basis. An individual road segment will fall into a particular category based on the strategy table’s output of repair types and will vary due to functional classification. The goal is to gain a broad understanding of the existing conditions in simple yet meaningful terms.

Table 1 - Treatment Band Descriptions

TREATMENT BAND	PCI*	Description
DO NOTHING	93-100	Excellent condition - in need of no maintenance.
ROUTINE MAINTENANCE	86-92	Good condition – may be in need of crack sealing or minor localized repair.
PREVENTIVE MAINTENANCE	73-85	Fair condition – pavement surface may be in need of surface sealing, full depth patch and/or crack sealing.
STRUCTURAL IMPROVEMENT	61-72	Deficient condition – pavement surface structure in need of added strength for existing traffic. Typical repairs are overlay with or without milling.
BASE REHABILITATION	0-60	Poor condition – in need of base improvement. Typical repairs are reclamation or full depth reconstruction.

Note: The Treatment bands are defined below.

*These are only general PCI ranges for reference purposes, and represent only one pavement type. There are several fields considered by the strategy table when assigning repair types to each individual street.

Do Nothing

The Do Nothing category exhibits roads which are in need of no maintenance. These roads are in excellent condition and existing distresses generally do not need to be addressed.

Routine Maintenance

Routine maintenance activities are those which are taken to correct a specific pavement distress. Routine maintenance usually addresses localized pavement defects and includes activities such as:

- Full depth patching;
- Skin patching;
- Crack sealing.

Preventive Maintenance

Preventive maintenance activities are those which are performed at planned intervals to protect and seal the pavement. Seals are designed to provide one or more of the following benefits:

- Prevent the intrusion of air and moisture;
- Fill small cracks and voids;
- Rejuvenate an oxidized binder;
- Provide a new wearing surface.

Structural Improvement

Structural improvement includes the work necessary to restore the pavement to a condition that will allow it to perform satisfactorily for several years. Generally a structural improvement will consist of milling the existing pavement down and applying a new Hot Mix Asphalt Overlay allowing existing grades to be maintained. When the existing grade can be increased a new Hot Mix Asphalt course can simply be placed upon the existing surface.

Structural improvements also include the work necessary to prepare the pavement for an overlay, either with or without milling. The major activities involved in the preparation process are:

- Partial depth patching;
- Full depth patching;
- Joint and crack sealing.
- Grinding and milling
- Hot Mix Asphalt Leveling Courses.

Base Rehabilitation

Base rehabilitation utilizes one of two methods:

- Reclamation;
- Reconstruction.

Reclamation is the process of rehabilitating existing deteriorated pavements. The existing pavement and base, subbase, and possibly subgrade are pulverized and blended to create a homogenous pavement base. This reclaimed pavement base is then paved with a new Hot Mix Asphalt surface.

Reconstruction is the complete removal and replacement of a failed pavement, and might also involve widening, realignment, traffic control devices, safety hardware, and major base and drainage work.

Customizing Repair Strategies

VHB met with the Town Municipal Services staff to review VHB's typical repair strategies, and to learn how to customize these strategies to meet the Town's specific needs. VHB also refined repair unit costs. VHB's goal was to understand Salem's decision-making process and simulate that process in the budget analysis software based on the pavement condition and other criteria of each pavement section.

Salem's pavement management system was configured to implement the Town's primary repair strategy including Reconstruction, Reclamation, Mill/Overlays, Preventive Maintenance Treatments, and Cracksealing.

Preparing Budget Scenarios

Once the roadway conditions are inventoried and analyzed, and the repair strategies are defined, the impact of various spending programs on the roadway network is assessed. These studies can range from 1 to 20 years; however, for the purpose of this report 10-year studies are used. The purpose of the budget planning process is to determine the impact of various spending levels to find a funding level that will best meet Salem's needs. The budget analysis software uses pavement deterioration curves, unit costs, and the strategy tables developed in the repair strategy definition phase to assign each street a repair type and associated cost for each year of the study. The software also assigns each street a benefit value that is used to prioritize which streets the software will select for repair each year. **It is important to understand that a pavement management system is a network-wide planning tool, and is not intended to give definitive street-by-street repair data. Field verification and testing are recommended to confirm any street repair list generated.**

Deterioration Curves

In order to properly plan for future repairs, the budget analysis feature of the pavement management system uses deterioration curves. The deterioration curves estimate the rate at which the pavement condition decreases over time. These pavement deterioration curves depict two major categories of functional classification - arterials and collectors (Operational Roads) in one curve and local roads in the other as well as a differentiation for pavement type. The curves used in this study were developed after a thorough evaluation of actual pavement deterioration rates observed in Salem during the Town's 2012 pavement management evaluation.

Project Prioritization

The budget analysis software prioritizes needed system repairs based on the estimated "Benefit Value". The Benefit Value formula is calculated using variables representing traffic volume, repair service life, PCI, and unit repair costs for each pavement management section. The calculation for the Benefit Value is shown below. For each plan year, the software prepares a future roadway condition projection, exhausts the assigned budget, and then produces an annual list of roads included in

the repair program. The system also allows the user to enter an inflation rate to account for estimated increases in future year construction costs. A 4% inflation rate was used for Salem's construction costs. While the cost of pavement maintenance and rehabilitation are closely tied to the potentially volatile fluctuation in the price of oil; in the long term, 4% has proven to be a reasonable assumption of project cost inflation, and has been used in this study as well as the previous pavement management studies performed in Salem.

The Benefit Value prioritization process generally favors cost effective maintenance alternatives. Repair actions are typically delayed on those sections that require reconstruction or major rehabilitation because the benefits for dollars spent are generally lower than maintenance candidates. After the relatively good roads are "saved", improvements are directed towards the poorer arterial and collector roads, and then to the local roads in need of major rehabilitation.

The calculation of Benefit Value is as follows:

$$\text{Benefit Value} = \frac{\text{ADT} * \text{Life of Repair}}{\text{PCI} * \text{Unit Cost of Repair}}$$

Current Pavement Conditions on Town Roads

VHB conducted the field evaluation of pavement conditions in the winter of 2017. The average PCI for Salem's paved road network was found to be an **81**. A PCI of 81 represents a road in fairly good condition. The average PCI is one point higher than it was after the 2012 study.

In discussion with Town officials, it was determined that there are two main subsets of roadways for which the Town may have different expectation on condition and analysis. These are the Operational roads which include the main network of collector roads used by a larger percentage of the population and local roads used by mostly local traffic. Additionally, there is a recent focus on the condition of Industrial Roads. This section will summarize the condition of the Town's road network as a whole, and also within these subsets.

The average PCI for the Town's entire Town Accepted network, as well as the subsets described above, are shown below. All mileages are for **paved** roads only. The Town also has 3.67 miles of gravel road.

- All Town Accepted Roads (180.8 miles) = 81 PCI
- Operational Roads (121.5 miles) = 87 PCI
- Local Roads (59.3 miles) = 78 PCI
- Industrial Roads (4.6 miles)* = 65 PCI

*Industrial Roads overlap with the the Operational and Local networks

This clearly shows that Salem has focused its attention on maintaining the condition of the roads used by most drivers, as is recommended by good pavement management practice.

The following chart shows the distribution of conditions in small PCI increments which give a more detailed picture of the state of Salem's roads.

Figure 1 **Current PCI Distribution All Roads**

Figure 1 shows that the Town has roads in a wide variety of conditions. The largest groupings are 86-95 which are in good and excellent condition, this indicates that maintenance of the good roads should be a priority in coming years to protect the investment in new pavement that the Town has made. The 60.6 miles of roadway between 71 and 85 PCI may be good candidates for Town to look at a surface treatment option to seal surface defects and slow the aging of the pavement by keeping rain, sun radiation, and oxygen away from the existing pavement structure.

Operational vs. Local Roads

The following chart breaks the pavement distribution down by Operational and Local Roads.

Figure 2 - PCI Distribution- by Functional Classification

This chart shows a fairly similar distribution of conditions between the local and operational roads, except the operational roads have a distinct increase in percentage of roads in the highest PCI bands, showing the significant recent investments in improving the condition of the operational road network.

Table 2 – PCI Distribution by Functional Class

PCI Band	Operational Roads (miles)	Local Roads (miles)
0-40	0.2	0.9
41-45	0.9	4.4
46-50	1.0	3.4
51-55	0.3	6.2
56-60	0.0	2.1
61-65	1.6	10.0
66-70	1.3	4.7
71-75	2.4	24.9
76-80	2.3	10.0
81-85	10.8	10.1
86-90	14.1	21.1
91-95	20.8	17.0
96-100	3.6	6.7
Total:	59.3	121.5

Backlog of Work

Applying the five treatment bands shown in Table 1 and unit costs referenced in Appendix A to Salem's road network, a summary of outstanding work was developed. The following tables and charts gives the miles and dollars associated with each treatment band for the conditions at the time of the evaluation.

The total backlog of work is shown to have decreased significantly from the amount calculated in 2012 of approximately \$43M. This change is caused by two main factors. The town's significant investment in its roads has drastically reduced the number of roads in the most expensive repair category, as is shown in more detail later in the report. However, a change in the configuration of the pavement management system has also had an effect. Previously, the local roads in the worst condition ranges were estimated to be reconstructed at \$80.50/SY. In the current configuration, those roads are projected to receive a reclamation at \$48/SY, yielding a perceived reduction in backlog.

Backlog of Work (All Paved Town Roads)

Table 3 - Summary of Miles and Dollars of Outstanding Work

Treatment Bands	Miles	% Miles	Cost	% Cost
Base Rehabilitation	18.5	10%	\$15,640,000	58%
Structural Improvement	37.3	21%	\$8,189,000	31%
Preventive Maintenance	41.7	23%	\$2,639,000	10%
Routine Maintenance	46.2	26%	\$270,000	1%
Do Nothing	37.1	20%		
Totals:	180.8		\$26,738,000	

Figure 3- Current Backlog Mileage by Treatment Band

Figure 4 – Current Backlog Cost by Treatment Band

Figures 6 and 7 show that while only about 10% of the Town's roads are in need of base rehabilitation, those miles make up 58% of the dollar backlog while the 46% of miles in the routine and preventive maintenance bands make up only about 11% of the dollar backlog.

This emphasizes the importance of maintaining the roads in good condition for short dollars, but also indicates considerable funds are needed to rehabilitate the roads in poor condition.

Backlog of Work (Operational Roads)

Table 4 - Summary of Miles and Dollars of Outstanding Work

Treatment Bands	Miles	% Miles	Cost	%Cost
Base Rehabilitation	2.4	4%	\$4,223,000	68%
Structural Improvement	3.2	5%	\$935,000	15%
Preventive Maintenance	15.2	26%	\$960,000	15%
Routine Maintenance	18.9	32%	\$119,000	2%
Do Nothing	19.7	33%		
Totals:	59.3		\$6,237,000

GIS Map of Current Pavement Conditions

By linking the Town's pavement database to a GIS roadway centerline, the Town is able to create thematic maps to help in the analysis and presentation of the information within the database. Having the system reside in the same GIS as the Town's other infrastructure data, such as water and sewer systems, will facilitate the coordination of projects between multiple public facilities. The following maps, which display current pavement condition, are examples of the possible types of maps that can be generated.

2003-2012-2016 Comparison

VHB originally surveyed the condition of all Town roads in 2003 and then updated the condition survey in 2012 and again in 2017. The town-wide average has been fairly consistent, going from a 79 in 2003, to the 80 that was found in 2012, to the 81 in 2017. However, the average PCI does not tell the whole story.

Comparing the distribution of miles of roadway in the PCI ranges that correlate to the 5 Treatment Bands, it is clear that the number of miles in the lowest PCI range has decreased significantly as the town has made a major investment in improving these roads.

Figure 15– 2003-2012-2017 PCI Distribution Comparison

Funding Scenarios Explored

VHB compared the predicted effects of the 2 funding scenarios below:

- **\$0 per year** – For comparison sake, this scenario projects what would happen if Salem did not fund pavement maintenance and rehabilitation for the next 10 years.
- **\$4.65 Million per year** – Projecting the expected results if Salem continues its current funding level for the next 10 years.
- **\$5.65 Million per year** - Projecting the the results of increasing funding to \$5.65 million per year to see the effect on the backlog of work.

The pavement management software used in this analysis is the same software that will be available to the Town to perform additional analysis. To produce the following analysis, the system follows these steps.

1. User inputs analysis parameters such as which roads to be analyzed, how many years, and what budget to use.
2. Each road segment's PCI is projected using deterioration curves, to the start date, and an average is calculated.
3. System determines the appropriate repair for each segment, prioritizes the repair list, and "fixes" them until the budget is exhausted.
4. Each non-fixed road segment PCI is deteriorated to the following year, and the process repeats.

Figure 16 on the following page summarizes the results of this analysis for the two scenarios selected for the 10-year study period.

Figure 16 – Projected Pavement Condition

The previous chart demonstrates that the current funding level would improve the conditions by 4 PCI points over the ten-year analysis period, whereas a lack of funding would allow a serious decline in town-wide conditions

Figure 17 – Projected Backlog Summary

This chart demonstrates that a lack of funding for the next ten years would allow the backlog of pavement maintenance work to skyrocket to over \$222,000,000 in ten years. \$5.65M per year would start to decrease the backlog.

All scenarios assume a 4% inflation in the costs of all repair alternatives each year.

Concluding Remarks

The Town of Salem's pavement management system is based on road condition data and descriptive information collected in 2017. It gives Town decision-makers a picture of existing roadway infrastructure conditions and a dollar estimate to improve streets in poor condition while protecting those pavements already in good condition.

To get the greatest value from the available funding, it is important that the Town of Salem consider the following:

- The Town should include routine and preventive maintenance treatments in its annual road program.
- It is always recommended to perform some subsurface sampling and testing and conduct an actual pavement design to determine whether mill and overlay or reclamation is the best choice on a project by project basis.

The Town has been making a very strong investment in its roadways and the results have been clear. The Town should continue to protect its investment by not only using the pavement management system to prioritize addressing the right roads at the right time, but also to do it in the right way. Studies have shown that roads paved with proper quality assurance measures will far outlast those without, and the town has seen evidence of this.

The Pavement Management System being implemented by the Town is a planning tool, with primary functions of determining the funding levels required to achieve Town-wide condition goals, and to identify candidate road projects to achieve those goals. Any project list generated by the system needs to be reviewed by Town staff and adjusted based on numerous factors, including coordination with utility work, and geographic issues.

Recommendations – Pavement Management

- Budget adequate funds to achieve pavement condition goals
- Make timely maintenance repairs
- Repair localized base problems before applying an overlay
- Address major rehabilitation needs as funding allows
- Develop multi-year road programs
- Coordinate with local utilities to perform upgrades and repairs in advance of projected construction projects
- Perform project level testing prior to major rehabilitation projects to ensure proper life of new pavement
- Provide for construction inspection at the plant and in the field to ensure quality material is provided and quality work is being performed
- Update database to reflect work that is done (maintains accuracy of system)
- Update pavement conditions at a minimum of every 4 years or 25% per year
- Track specific and overall conditions periodically
- Evaluate funding levels periodically

Appendix A: Unit Costs

Treatment Description	PCI Range*	Unit Cost (\$/SY)
Local Maintenance (Crack Seal and Patch)	86-92	\$0.40
Preventive Maintenance (Extensive Crackseal/Patch or Surface Treatments)	72-85	\$4.75
Mill & Overlay Local	58-72	\$15.00
Mill & Overlay Operational	58-72	\$17.00
Reclaim Local	0-58	\$48.00
Reclaim Operational	0-58	\$100.00
Reclaim Local w/ sidewalks & curbs	0-58	\$150.00
Reconstruct Operational	0-58	\$151.00
Reconstruct Operational w/ sidewalks & curbs	0-45	\$200.00

*PCI ranges are approximate. Additional factors determine repair alternative selection.

Appendix B – Pavement Inventory Report

Listing of all pavement segments in the Town's database, grouped by that road's acceptance status, with the segment's pavement type, functional classification, length, and PCI.

Pavement Inventory Report (by Acceptance/Alphabetical)

Appendix C– Pavement Backlog Report

Listing of all Town-maintained pavement segments with the system generated repair recommendation, estimated cost of repair, and relative “Benefit Value” of doing the work, grouped by the “Treatment Band” of the repair.

Scenario Result Report - by Treatment Band, Benefit Value Descending

Budget Scenario: 2017 Current PCI
