Introduction

The Town of Salem retained BETA Group, Inc. (BETA) in the Spring of 2022 to provide pavement management services to better maintain the Town's roadway network. The Town had previously conducted similar pavement condition assessments in 2012 and 2017 using a different engineering consultant. This comprehensive study was undertaken with the goal of establishing an extensive database of roadway surface conditions to produce a prioritized list of improvements. The Pavement Management Program (PMP) is a GIS centric planning tool intended to provide the foundation to manage the Town's roadway resources in conjunction with local institutional knowledge. These efforts will ultimately aid the Town in the development of future capital improvement plans as well as budgeting scenarios to predict how the network Pavement Condition Index (PCI) will adjust in the future.

As part of this project, BETA also assessed gravel roadways to establish a baseline of current conditions to assist with future planning.

Pavement Management Approach

Pavement management is based on the theory of predicting roadway deterioration over time. This theory allows pavement managers to perform timely maintenance designed to extend the roadway's life and avoid more costly and extensive structural repairs. A key aspect of pavement management, as illustrated by the Pavement Deterioration Curve below (Figure 1), is the recognition that roadways deteriorate in an accelerated fashion at specific times in the roadway lifecycle. By conducting timely maintenance, the lifespan of roadways in the top half of the pavement deterioration curve can be significantly extended. Understanding this concept allows opportune decisions that yield the most cost-effective results.

Implementing a PMP involves identification of the road network, evaluation of its surface conditions, and specification of its maintenance practices and associated repair costs. Roadway condition data is compiled to facilitate the calculation of a PCI for each individual street segment. This range includes a possible low value of 0 for a road characterized by a high severity of distress, and a possible maximum value of 100 for a road with no visible defects. Ultimately, the PCI value allows each roadway segment to be placed into a planning level repair category.

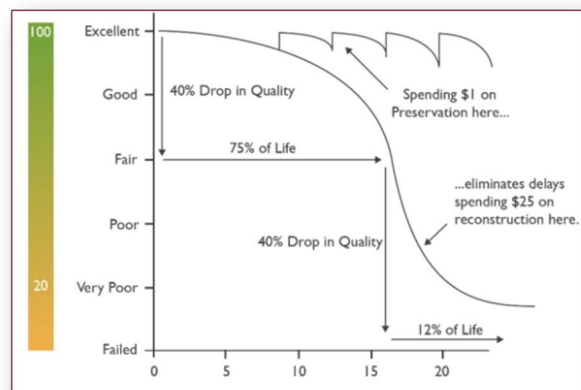

Figure 1 – The pavement deterioration curve shows the typical lifecycle of a bituminous asphalt roadway

System Setup & GIS Configuration

The Town provided BETA a GIS roadway centerline file to use as the foundation for the data analysis, reporting and mapping for this project. Each roadway was broken down and analyzed at both the entire street as well as the street segment level (typically intersection to intersection). This allowed for more detailed data analysis to be carried out at the segment level in addition to providing an overall average PCI for each roadway (end to end). Utilizing data provided by the Town, BETA also identified specific roadways as operational (typically arterial and collector roads) to assist in cost estimating and suggested repair identification. Finally, BETA coded the past ten years of paving improvements into the database to serve as a log for record keeping and historical tracking utilizing GIS software.

Roadway Survey

The roadway survey in Salem, consisting of paved, Town maintained roadways, was completed in the Spring of 2022. A total of **183.94** centerline miles of paved roadways were inspected serving as the basis for this report. As part of this study, BETA also conducted manual inspections on **3.51 centerline miles** of Town maintained gravel roadways. The Town is also comprised of approximately 14.12 miles of private roadways and 26.69 miles of state roadways. Neither private nor state roadways were included in the condition assessment. Figure 2 below symbolizes the Town's roadway network by maintenance.

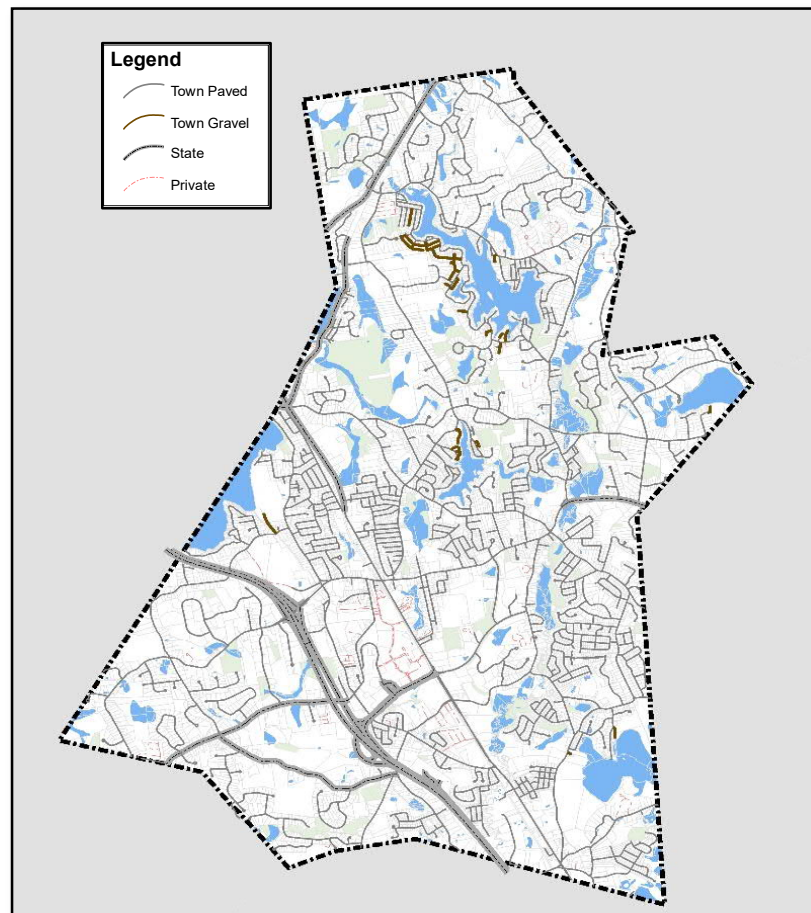

Figure 2: Overall Roadway Network Map for the Town of Salem

For Town maintained paved roadways, data collection was performed autonomously utilizing lidar technology through BETA's partner Cyvl.ai (Cyvl). Each road segment was scanned by a lidar sensor mounted to a motor vehicle equipped with GPS and high-resolution cameras to generate a high-quality digital map of the environment. This map includes hundreds of measurements per square foot of the surrounding physical infrastructure. Forward facing camera photographs as well as 360 degree angle imagery was captured and delivered as part of this project.

Upon completion of the field inspections, the collected sensor data was then analyzed with Cyvl's data processing algorithms that identify specific pavement distresses in the 3D LiDAR and 2D image data. This information is used to calculate a 0-100 PCI score related to the condition of the pavement based on the types of defects identified and their size/severity. The methodology used to generate the pavement scores by the software is derived from understanding how similar types of distresses, distress extent, distress severity, and road geometry influences pavement ratings across thousands of miles of data in Cyvl's proprietary pavement dataset.

The result of applying this learned relationship is an automated score that correlates with the industry standard ASTM Pavement Condition Index (PCI) and includes several of the common PCI asphalt distresses along with other specialized information and methods to assess the pavement. The following pavement distresses are considered by the software and their area size/severity are compared against the area of the road:

- *Alligator Cracking*
- *Edge Cracking*
- *Longitudinal and Transverse Cracking*
- *Patching and Utility Cuts*
- *Block Cracking*

The following pavement distresses are considered by the software and the 3D lidar pavement geometry is compared against the surface profile of a newly paved road:

- *Depression*
- *Potholes*
- *Rutting*
- *Shoving*
- *Swells*

This automated scoring process has been evaluated on thousands of miles of New England road conditions and provides an objective measurement of pavement conditions that can be used to prioritize maintenance and repair operations.

Figure 3: Image of BETA's hybrid vehicle equipped with lidar scanner

PCI Defined

Implementing a PMP involves identification of the road network, evaluation of its surface conditions, and specification of its maintenance practices and associated repair costs. Roadway condition data is compiled to facilitate the calculation of a PCI rating for each street segment. This range includes a possible low value of 0 for a road characterized by a high severity of distress, and a possible maximum value of 100 for a road with no visible defects. Ultimately, the PCI value allows each roadway segment to be placed into a planning level repair category with an associated estimated improvement cost.

Repair Categories

By utilizing the PCI, each roadway segment is placed into one of five major “repair categories” within the PMP as outlined below in Figure 4. These categories are designed to, in general, summarize the data at the network level while aiding the Town in the prioritization and planning of future roadway projects year to year. BETA met with Town staff multiple times to finalize repair bands, PCI ranges and establish unit pricing for cost estimating.

Repair Band	PCI Range	Repair Band Description
Defer Maintenance	92-100	Excellent Condition – Pavement needs no immediate repairs or maintenance at this time.
Routine Maintenance	85-92	Good Condition – Maintenance activities such as localized patching or crack sealing to address any minor areas of concern.
Preventative Maintenance	72-85	Fair Condition – Some surface deterioration present. Pavement surface may need surface treatment or thin overlay
Minor Rehabilitation	60-72	Poor Condition – Pavement surface structure needs added strength for existing traffic. Typical repair in this category is a mill and overlay
Major Rehabilitation	0-60	Deficient Condition – Typically, the base layers of the pavement need to be rebuilt. The implementation of a reclamation or full depth reconstruction is needed.

Figure 4: Breakdown of five repair band categories by PCI range and general condition.

The following provides a more detailed description of the bands presented in Figure 4.

Defer Maintenance (92-100 PCI)

These roads are in excellent condition and have very minor (if any) distresses present. Roads falling into this category have likely been recently resurfaced or improved within the past five year.

Routine Maintenance (85-92 PCI)

Roads categorized under the routine maintenance umbrella are typically beginning to show low levels of linear and alligator cracking, or roads that may becoming oxidized. Routine maintenance treatments that can be applied under this band include:

- *Crack Sealing*
- *Fog Sealing*
- *Localized Patching*
- *Pavement Rejuvenators*

Preventative Maintenance (72-85 PCI)

Roads falling under the preventative maintenance grouping are typically showing moderate levels of linear, alligator and edge cracking. The pavement surface may be oxidized, and depressions and small potholes may be beginning to form. Seals are a good option at this stage of a roads lifespan to extend the lifecycle of the roadway and to help minimize accelerated roadway deterioration. Certain treatments that can fall into this category include:

- *Hot Mix Asphalt (HMA) Overlay*
- *Cape Seal*
- *Thin Overlay/Bonded Wearing Course*
- *Crack Sealing*

Minor Rehabilitation (60-72 PCI)

In general, roadways falling in the minor roadway category have significant deterioration present at the surface level. Moderate to severe cracking is generally present throughout the entirety of a road segment as well as the possibility for potholes and patching. Roads in this category may also be experiencing issues with roadway unevenness, roughness, raveling and drainage issues.

In general, a minor rehabilitation technique requires removing 1.5-3" of existing pavement and applying a new top coat, generally HMA (Mill and Overlay). Newer technological advancements in the paving industry have allowed for the existing deteriorated surface to be recycled and then topped with HMA or other wearing surfaces. Typical treatment types under this category include:

- *Mill and Overlay*
- *Hot In-Place Recycling*
- *Cold In-Place Recycling*

Major Rehabilitation (0-60 PCI)

Roadways scoring below a 60 PCI generally have surface and base issues and are commonly recommended for one of two improvements: Reclamation or Full Depth Reconstruction. Pavements have deteriorated to the point where a form of full depth improvement are recommended to restore the quality of a road and reset its lifecycle.

Reclamation is the process of uniformly pulverizing and blending the full thickness of the asphalt pavement and a predetermine portion of the underlying material to generate an upgraded base material. The material is then shaped and compacted with a surface or wearing course. A Full Depth Reconstruction is the process of completely removing the existing asphalt and base course present to rebuild the roadway.

Future Pavement Deterioration

To predict future PCI values, the PMP mimics Federal Highway's standard pavement deterioration curve to predict future pavement degradation. Roadways in excellent and good condition at the top of the pavement deterioration curve will deteriorate at a lesser rate than roads in poor and deficient condition that are already displaying significant deterioration. Although there are other factors that will ultimately determine how each specific road will degrade over time (i.e. harsh winters, how a road was constructed, freeze/thaw cycle, etc.), the pavement deterioration curve is a traditional model utilized by many federal and local agencies to predict how roadways will decline over time in an accelerated fashion. With this in mind, predictive modeling is only so accurate, signaling the importance of re-inspecting the Town's road network every three to five years to keep both the pavement condition data and imagery current.

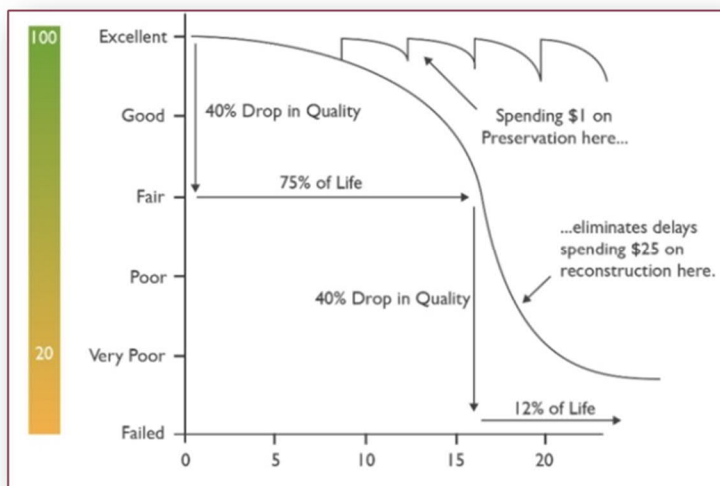

Figure 5 – The pavement deterioration curve shows the typical lifecycle of a bituminous asphalt roadway

Please note, the deterioration formula utilized in the program mimics the above pavement deterioration curve based on the following parameters:

RSR Range	Annual Deterioration Rate
90-100	1.5
80-90	2
70-80	2.5
60-70	3
20-60	5
0-20	2

Summary of Findings

Overall Backlog Summary

Upon completion of the field data collection and post processing, the **overall PCI for Salem's Town maintained roadway network was 79.77**. The network PCI rating is a weighted average by square yards which gives more emphasis to longer and wider road segments with greater paved surface area. The current network rating also accounts for all 2022 paving improvements completed by the Town which were updated into the database following the field inspections. A network PCI of 79.77 indicates that the Town of Salem's roadway network is generally in good condition. The overall PCI represents a benchmark for performance measuring of the Town's pavement management program moving forward. If the overall PCI were to drop in the years to come, this would be a sign that the program may need to be adjusted or funding for the program may need to be reevaluated.

It should be noted that the current PCI of 79.77 is roughly equal to the network PCI calculated in previous assessment conducted in 2017. Differences in inspection methodology between two different consultants can contribute to a slight difference in network condition score. From our discussions with the Town, it is our understanding that the previous assessment was conducted manually by a lead field inspector where pavement distresses were logged from visual observations. Utilizing a lidar sensor for this inspection, PCI's at the street level can be slightly harsher as additional distresses such as smaller cracks are identified that may be missed by the human eye as part of a manual inspection. Ultimately, this can lead to slightly lower PCI scores.

As part of the pavement management process, repair strategies and associated unit costs were defined (as shown in the following figures) to develop the Town's Backlog Summary. This analysis summarizes the mileage of roadway that fall within each suggested repair category as well as the estimated cost based to complete the recommended maintenance or repair.

Figures 6-8 on the following pages provide a graphical breakdown of the overall summary of findings.

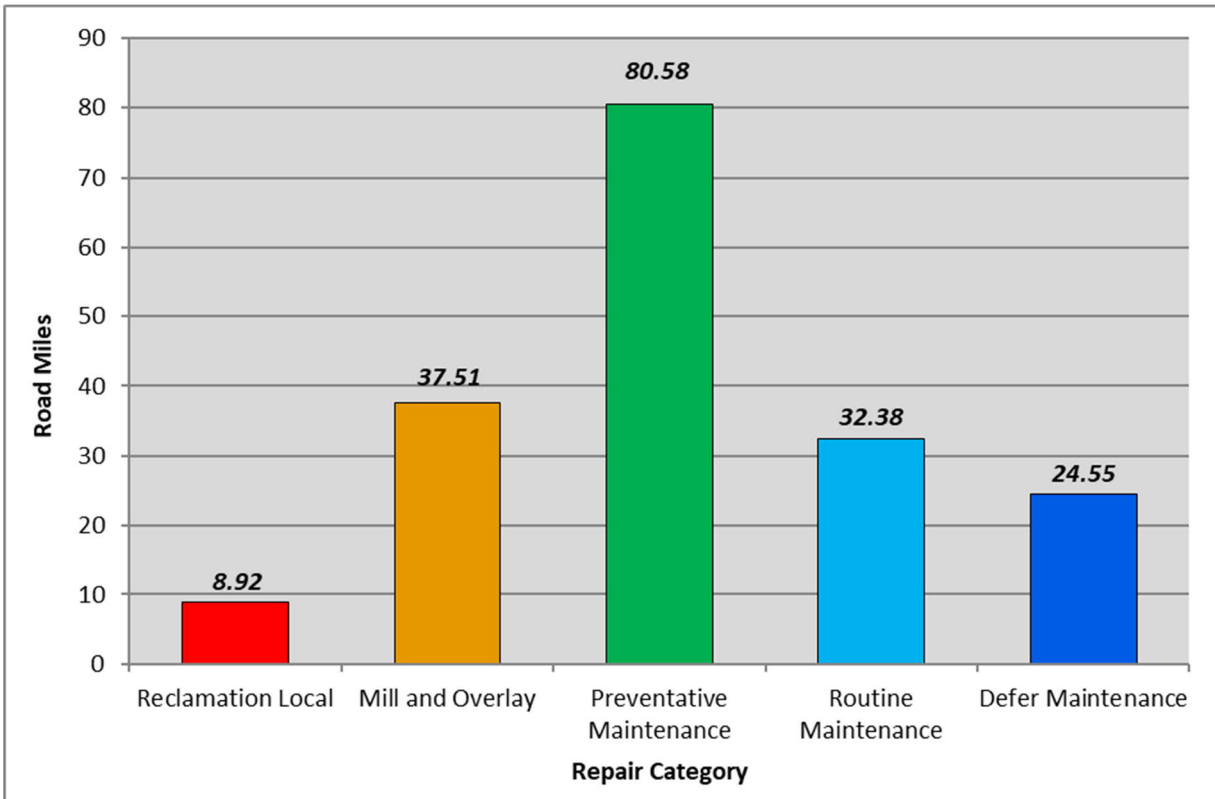

Figure 6: Summary chart of total miles within each suggested repair category (Entire Roadway Analysis)

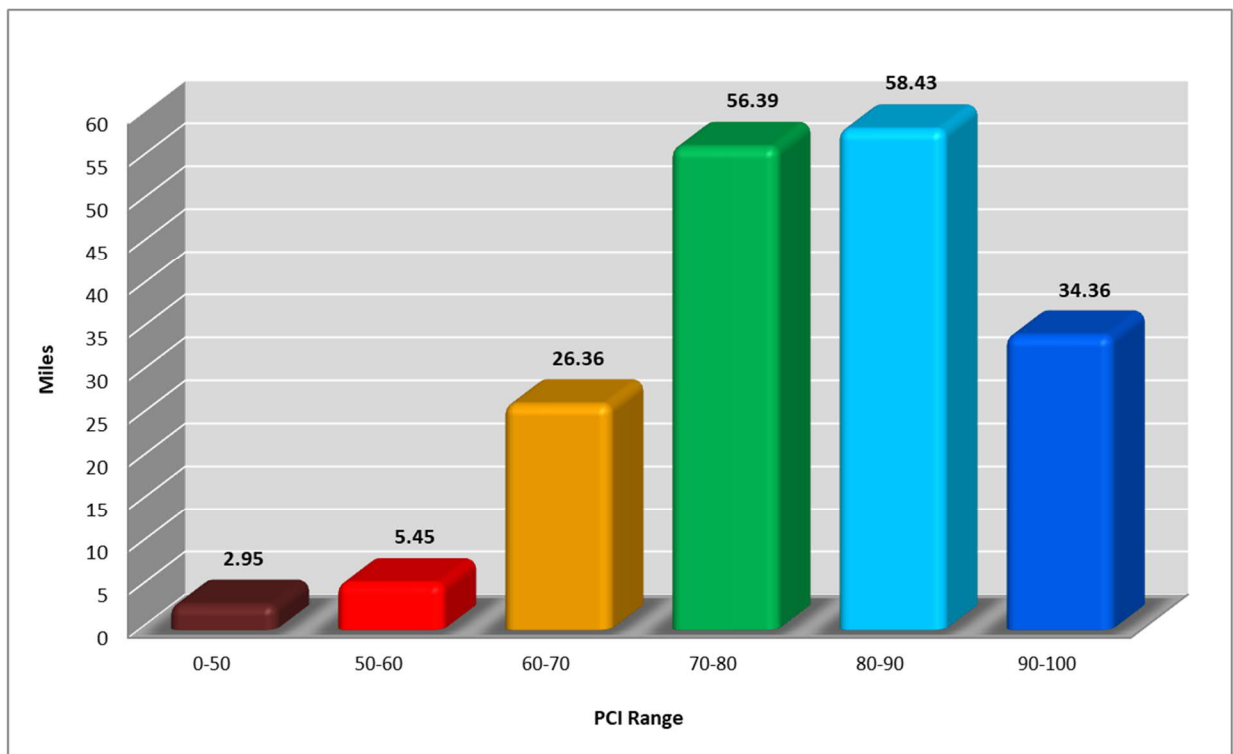

Figure 7: PCI distribution by intervals (Entire Roadway Analysis)

PCI Breakdown by Repair Category – by Entire Roadway					
Repair Method	PCI Range	General Condition	Square Yards	Length (Mi.)	% Repair
Reclamation Local	0-60	Deficient	121,081	8.92	4.85%
Mill and Overlay	60-72	Poor	539,182	37.51	20.39%
Preventative Maintenance	72-85	Fair	1,289,436	80.58	43.81%
Routine Maintenance	85-92	Good	487,791	32.38	17.60%
Defer Maintenance	92-100	Excellent	339,629	24.55	13.35%
Total			2,777,119	183.94	100%

Figure 8: Summary table of total miles within each repair category

From the above figures, approximately 75% of the road network is categorized as either in excellent, good or fair road condition. Of these roads, approximately 13% fall in the defer maintenance category (excellent), 18% in the routine maintenance category (good) and 44% in the Preventative maintenance group (fair). Conversely, approximately 25% of the road network are in either poor (20.5%) or deficient condition (4.5%). Ultimately, this breakdown of the entire Town's roadway network exemplifies the network average 79.77 PCI rating, further symbolizing that in general the Town's roadway network is in good condition.

Summary of Findings by Functional Classification

The overall data has also been broken down into the individual functional classification for each roadway based on the Town's jurisdiction. Below, please find an overall breakdown of condition for each roadway functional classification:

PCI Breakdown by Functional Class			
Func. Class	AVG. PCI	Total Miles	% of Network
Arterial*	79.02	6.70	3.64%
Collector*	81.86	51.73	28.12%
Local	78.96	88.23	47.97%
Cul De Sac/Dead End	78.78	37.28	20.27%
Overall	79.77	183.94	100.00%

Figure 9: Summary of total miles within each repair category broken down by roadway functional classification

*Operational Road Categories

All four roadway functional classes have an average PCI score of at least 78. Although the operational roads in the arterial and collector roads have slightly higher PCI averages than the local road categories, the Town is putting emphasis on balancing its roadway improvement program between operational and local roadway based on the data represented in Figure 9.

Estimated Backlog of Work (All Roads)

Based on the overall summary of findings, **the current backlog summary for the Town's public roadway network is approximately \$40.5 Million** (see Figure 11 below). This budgetary dollar figure represents a snapshot of the funding it would take to perform all outstanding maintenance for the Town's road network within the next year. While this is not typically feasible, this analysis acts as another benchmark for the magnitude of work necessary at the time of inspections.

Below is a breakdown of unit prices per square yard established for each repair band. BETA worked extremely closely with the Town determine appropriate pricing estimates based on current market trends, especially recent price hikes in the price of asphalt and general labor.

Repair Method	PCI Range	Unit Price (sy)	2023 Bid
Reconstruction Operational w/Sidewalks & Curb Ramps*	0-60	\$240.00	-
Reconstruction Operational*	0-60	\$190.00	-
Reclamation Operational*	0-60	\$136.00	\$140
Reclamation Local	0-60	\$84.00	\$86
Mill and Overlay	60-72	\$34.00	\$34
Preventative Maintenance	72-85	\$9.00	-
Routine Maintenance	85-92	\$0.75	\$2.01
Defer Maintenance	92-100	\$0.00	-

Figure 10: Summary of repair method categories with PCI ranges and unit prices

***Please Note – Based on current PCIs, there are no suggested treatments in these repair categories when analyzing the data at the entire road level**

The following series of tables and charts break down the estimated current backlog of work based on the above defined unit prices.

Estimated Roadway Improvement Costs					
Repair Method	Length (Mi.)	Sq. Yards	% Repair	% Cost	Estimated Cost
Reclamation Local	8.92	121,081	4.85%	23.76%	\$10,170,856
Mill and Overlay	37.51	539,182	20.39%	46.38%	\$18,332,183
Preventative Maintenance	80.58	1,289,436	43.81%	28.95%	\$11,604,925
Routine Maintenance	32.38	487,791	17.60%	0.91%	\$365,842
Defer Maintenance	24.55	339,629	13.35%	0.00%	\$0
Total	183.94	2,777,119	100%	100%	\$40,473,807

Figure 11: Summary table of repair method breakdown with estimated costs (Entire Road Analysis)

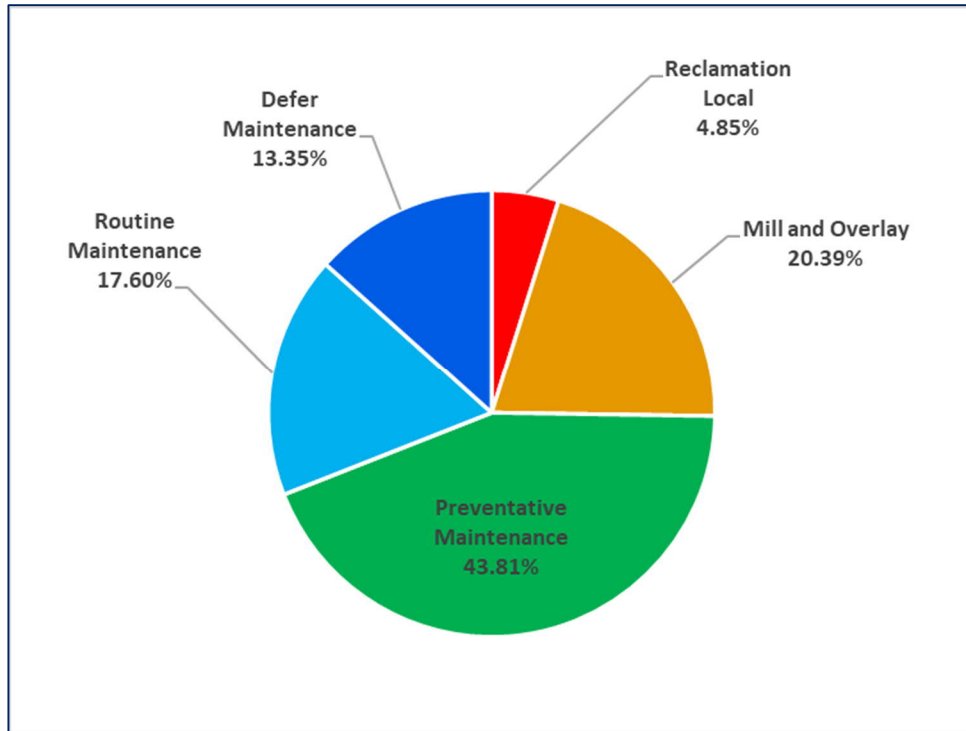

Figure 12: Pie chart backlog of total road mileage by repair category (Entire Street Analysis)

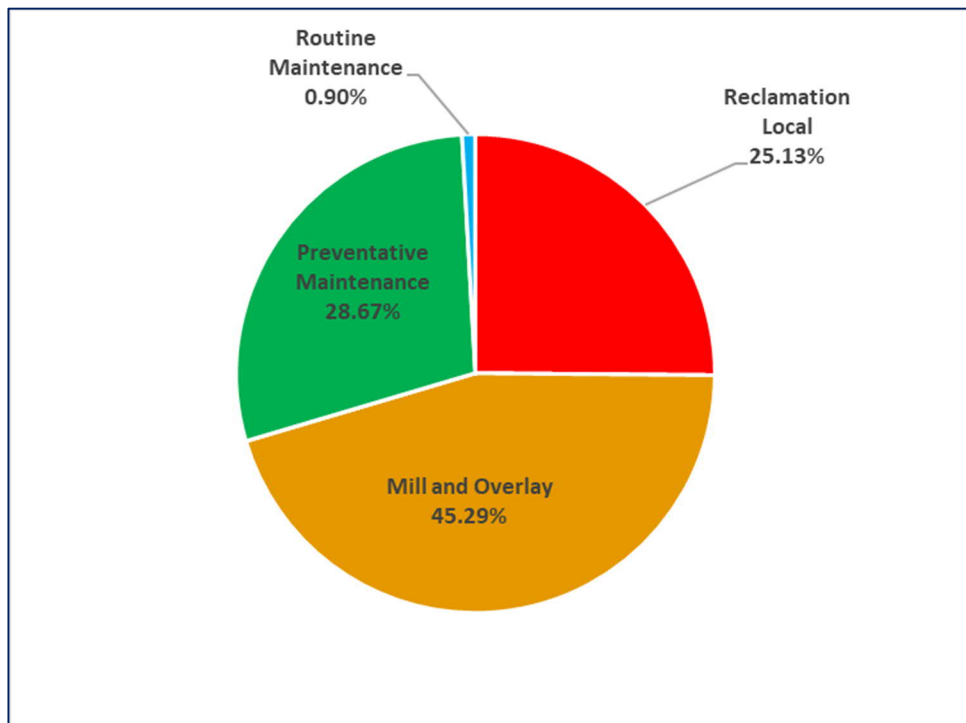

Figure 13: Pie chart backlog of total estimated cost percentage by repair category (Entire Street Analysis)

When analyzing the charts in Figures 12 and 13, while only roughly 25% of the network makes up roads in the Mill and Overlay and Reclamation bands, the estimated costs to improve these roads makes up roughly 70% of the estimated backlog. On the other hand, roads in the routine and preventative bands make up roughly 61% of the network but make up only 30% of the estimated backlog. This emphasizes the major theory of pavement management to keep roads in good condition to stretch the Town's paving budget to the fullest extent.

Similar trends are found in the following tables and charts for operational and local roadways.

Estimated Backlog of Work (Operational Roads)

Estimated Roadway Improvement Costs					
Repair Method	Length (Mi.)	Sq. Yards	% Repair	% Cost	Estimated Cost
Mill and Overlay	7.22	119,150	12.36%	39.59%	\$4,051,113
Preventative Maintenance	35.63	670,910	60.99%	59.01%	\$6,038,193
Routine Maintenance	12.20	190,762	20.88%	1.40%	\$143,071
Defer Maintenance	3.37	47,004	5.77%	0.00%	\$0
Total	58.42	1,027,826	100%	100%	\$10,232,377

Figure 14: Summary table of repair method categories with estimated costs for operational roadways (Entire Street Analysis)

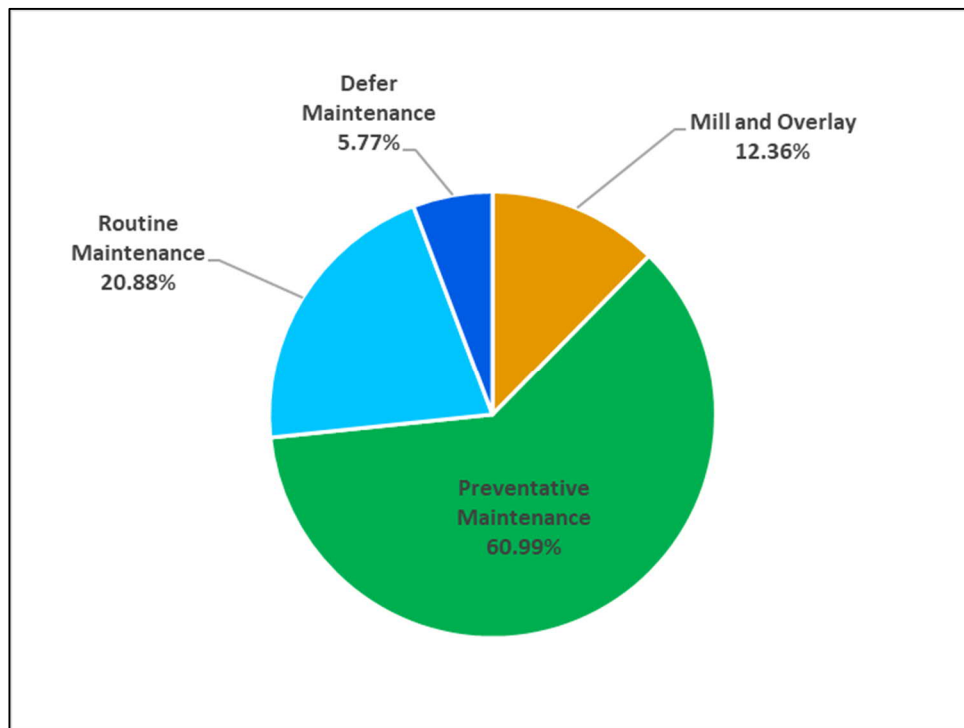

Figure 15: Pie chart backlog of total road mileage by repair category for operational roadways (Entire Street Analysis)

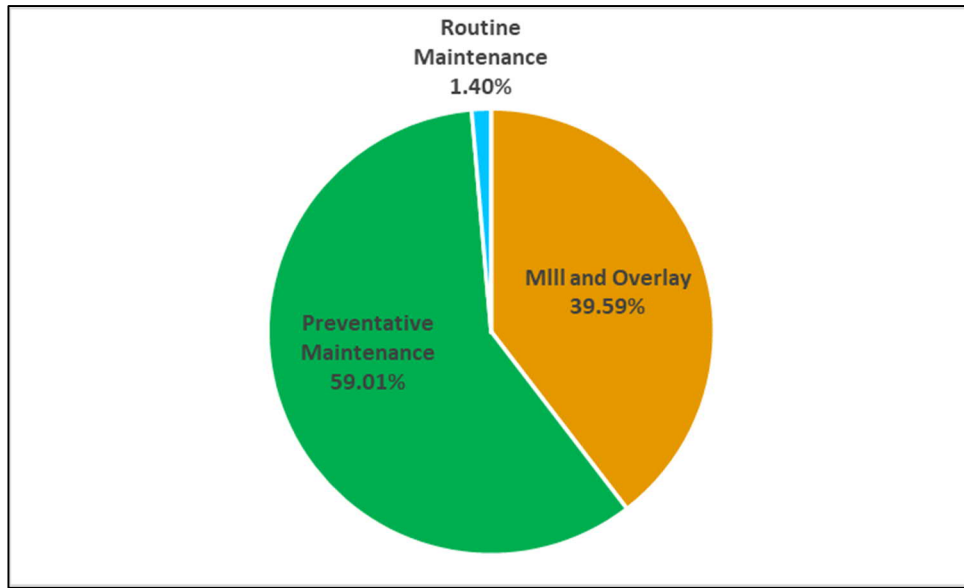

Figure 16: Pie chart backlog of estimated cost percentage by repair category for operational roadways (Entire Street Analysis)

Estimated Backlog of Work (Local Roads)

Estimated Roadway Improvement Costs					
Repair Method	Length (Mi.)	Sq. Yards	% Repair	% Cost	Estimated Cost
Reclamation Local	8.92	121,082	7.11%	33.63%	\$10,170,855
Mill and Overlay	30.29	420,031	24.13%	47.22%	\$14,281,071
Preventative Maintenance	44.95	618,526	35.81%	18.41%	\$5,566,732
Routine Maintenance	20.18	297,029	16.08%	0.74%	\$222,772
Defer Maintenance	21.17	292,625	16.87%	0.00%	\$0
Total	125.51	1,749,293	100%	100%	\$30,241,430

Figure 17: Summary table of repair method categories with estimated costs for local roadways

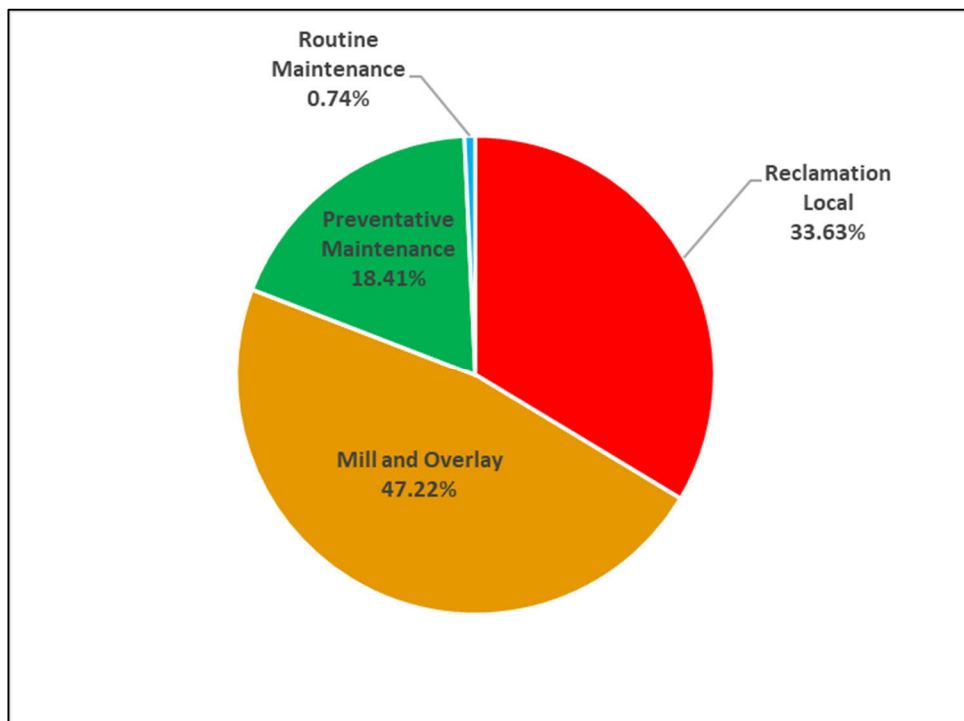

Figure 19: Pie chart backlog of estimated cost percentage by repair category for local roadways (Entire Street Analysis)

Gravel Road Inspections

As part of this project, BETA also assessed 3.51 miles of Town maintained gravel roadways for general condition. Gravel roadways were not assessed by the lidar sensor but rather manually in the field by BETA's lead roadway inspector. Each roadway segment was digitized in GIS and populated for the following gravel roadway distresses that were identified in the field:

- *Mud/Drainage Issues (Yes/No)*
- *Potholes (Yes/No)*
- *Loose Aggregate (High/Moderate/Low)*
- *Rutting (Yes/No)*
- *Roadway Cross Section (Good/Poor)*
- *Rideability (Good/Poor)*

Upon completion of the field assessment, each gravel roadway segment was scored from 0 to 10 (worst to best) based on the following matrix:

- *Mud/Drainage Issues (Yes -3 points/No 0 points)*
- *Potholes (Yes -2 points/No 0 points)*
- *Loose Aggregate (High -2 points/Moderate -1 point/Low 0 points)*
- *Rutting (Yes -1 point/No 0 points)*
- *Roadway Cross Section (Good 0 points/Poor -1 point)*
- *Rideability (Good 0 points/Poor -1 point)*

The following figures (19, 20) summarize the findings of the gravel roadway field inspection program.

Gravel Score	Count of Segments	Square Yards	Length (Miles)	% Length
10	2	838.91	0.11	3.1%
9	9	4,536.43	0.48	13.7%
8	5	4,976.55	0.51	14.6%
7	6	3,758.61	0.42	12.0%
6	9	7,399.03	0.72	20.6%
5	3	3,078.90	0.32	9.1%
4	5	6,329.10	0.66	18.9%
3	2	1,130.80	0.10	2.9%
2	1	985.66	0.11	3.1%
1	1	698.84	0.07	2.0%
Total	43	33,732.83	3.50	100.0%

Figure 20: Summary table of gravel roadway condition data

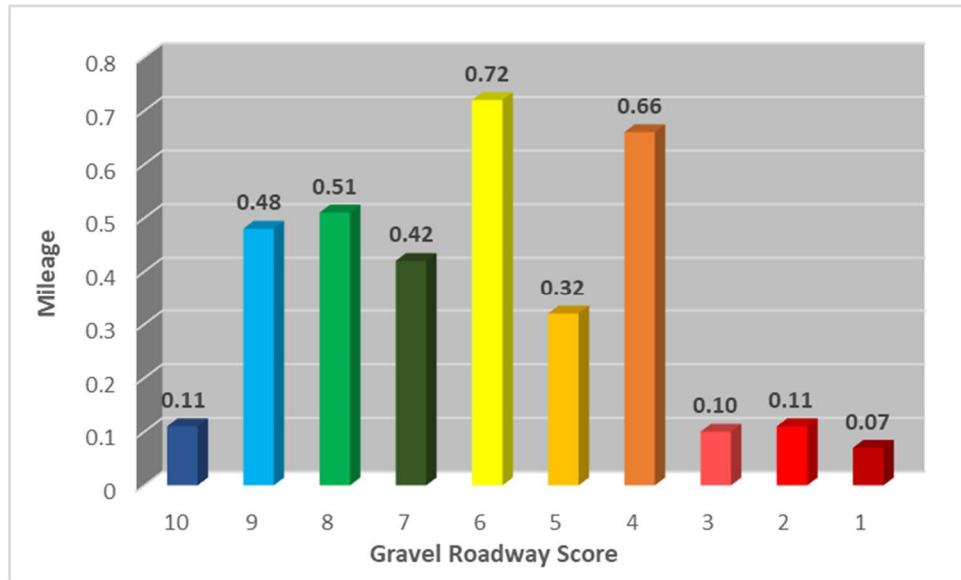

Figure 21: Summary bar chart of gravel roadway condition data broken out by mileage

The overall average gravel roadway score calculated at **6.12**. Comparable to the pavement condition index calculated for paved roadways, the average score for gravel roadways is weighted by square yard. The estimated cost to convert all gravel roads to paved is approximately **\$4.72 million**. This is based on an assumed unit price of \$140 per square yard that was determined by the Town based on current market trends and historical pricing.

It is BETA's understanding that the Town is interested in converting a significant number of its gravel roadways to paved. There are certain benefits to paving a gravel road:

- Reduces annual maintenance to upkeep gravel roads.
- Eliminates dust control issues
- Helps seal off water intrusion, which helps protect the base and subgrade and helps prevent drainage issues/washouts
- Smooth Riding Surface
- Public Perception

Prior to converting gravel roads to paved, it is essential to address any drainage issues before beginning the conversion. If not addressed before converting to pavement, this could ultimately lead to more costly washout issues post construction and a rapidly deteriorating roadway. It is also imperative to compact the existing gravel thoroughly to establish a good foundation for the new paved road. Assuming all gravel roads are eligible for conversion and the Town is looking to make the investment, BETA would recommend addressing roads with existing mud/drainage issues first. These are generally roads with the lowest roadway scores and likely require the most upkeep and maintenance. Roads with higher scores are in better condition, likely require less maintenance and will likely hold out for a longer period of time.

Please note, a cost-effective alternative of gravel to paved road conversion would be to compact the existing road and double chip seal. This is a cheaper option that will save the Town money and helps prevent washout/drainage issues that may be more common with a gravel roadway.

GIS Figures/Online Platform

As previously introduced, BETA's PMP is compatible with ESRI GIS software and has been tied to the Town's existing GIS based roadway centerline file. The data can be accessed through ESRI's ArcGIS platform at both the desktop and web-based level. As part of the deliverable for this project, BETA will deploy its ArcGIS Online (AGOL) based platform to the Town to allow for the end user to view and utilize the data as a planning level tool. Various widgets have been carefully designed to highlight different aspects of pavement data for use by the Town. Data can be pulled down to the desktop level for editing and customization. Other roadway assets such as sidewalks, signs and utility data can also be integrated into the platform to expand its use and serve as a standalone asset management site. Additionally, the imagery captured as part of the field inspection process for this project is also available for viewing purposes within the platform through a hyperlinked point file.

The following GIS figures display PCI data at both the entire townwide network as well as at the operational and local roadway network levels, demonstrating a few examples of the different types of GIS graphics that can be generated through the software. A GIS figure of all gravel roadway scores is also included below.

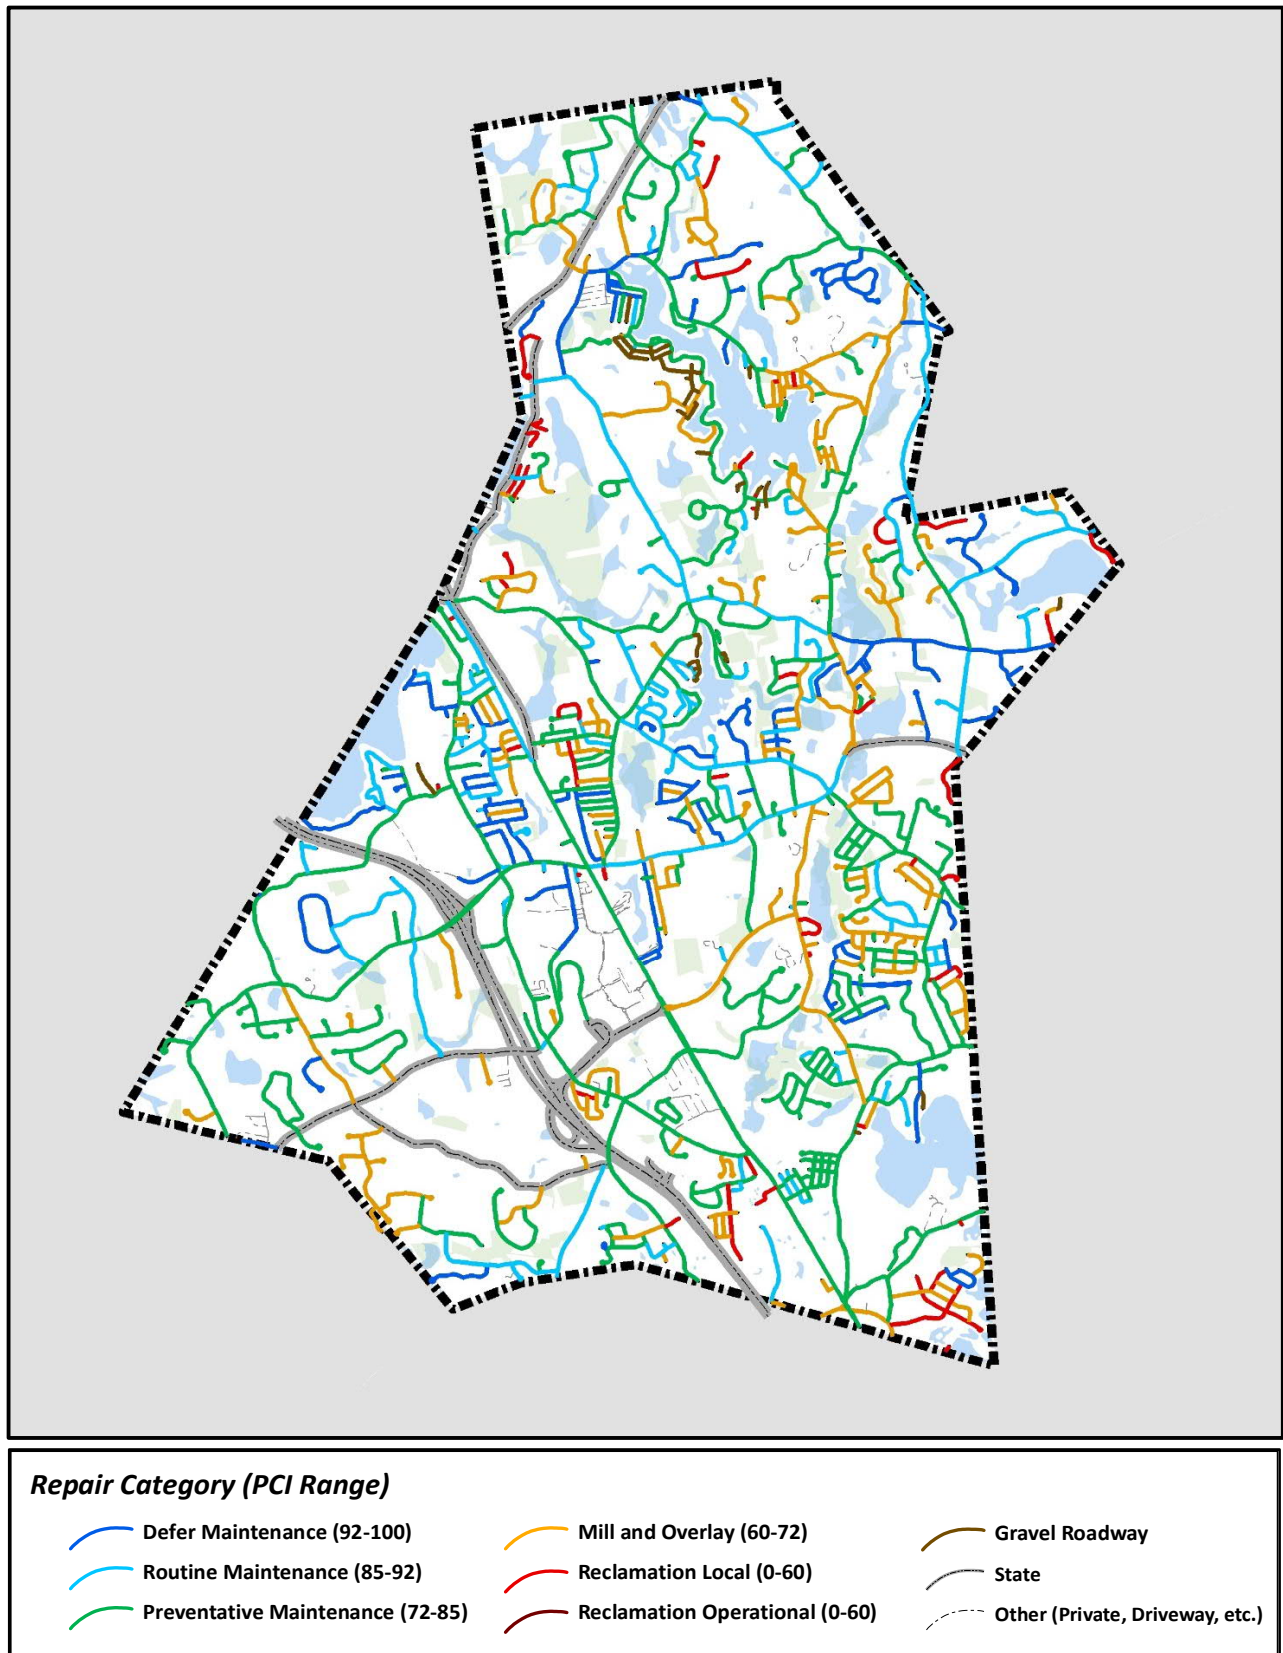

Figure 22: GIS graphic symbolizing all Town Maintained roadways by PCI range (Entire Street)

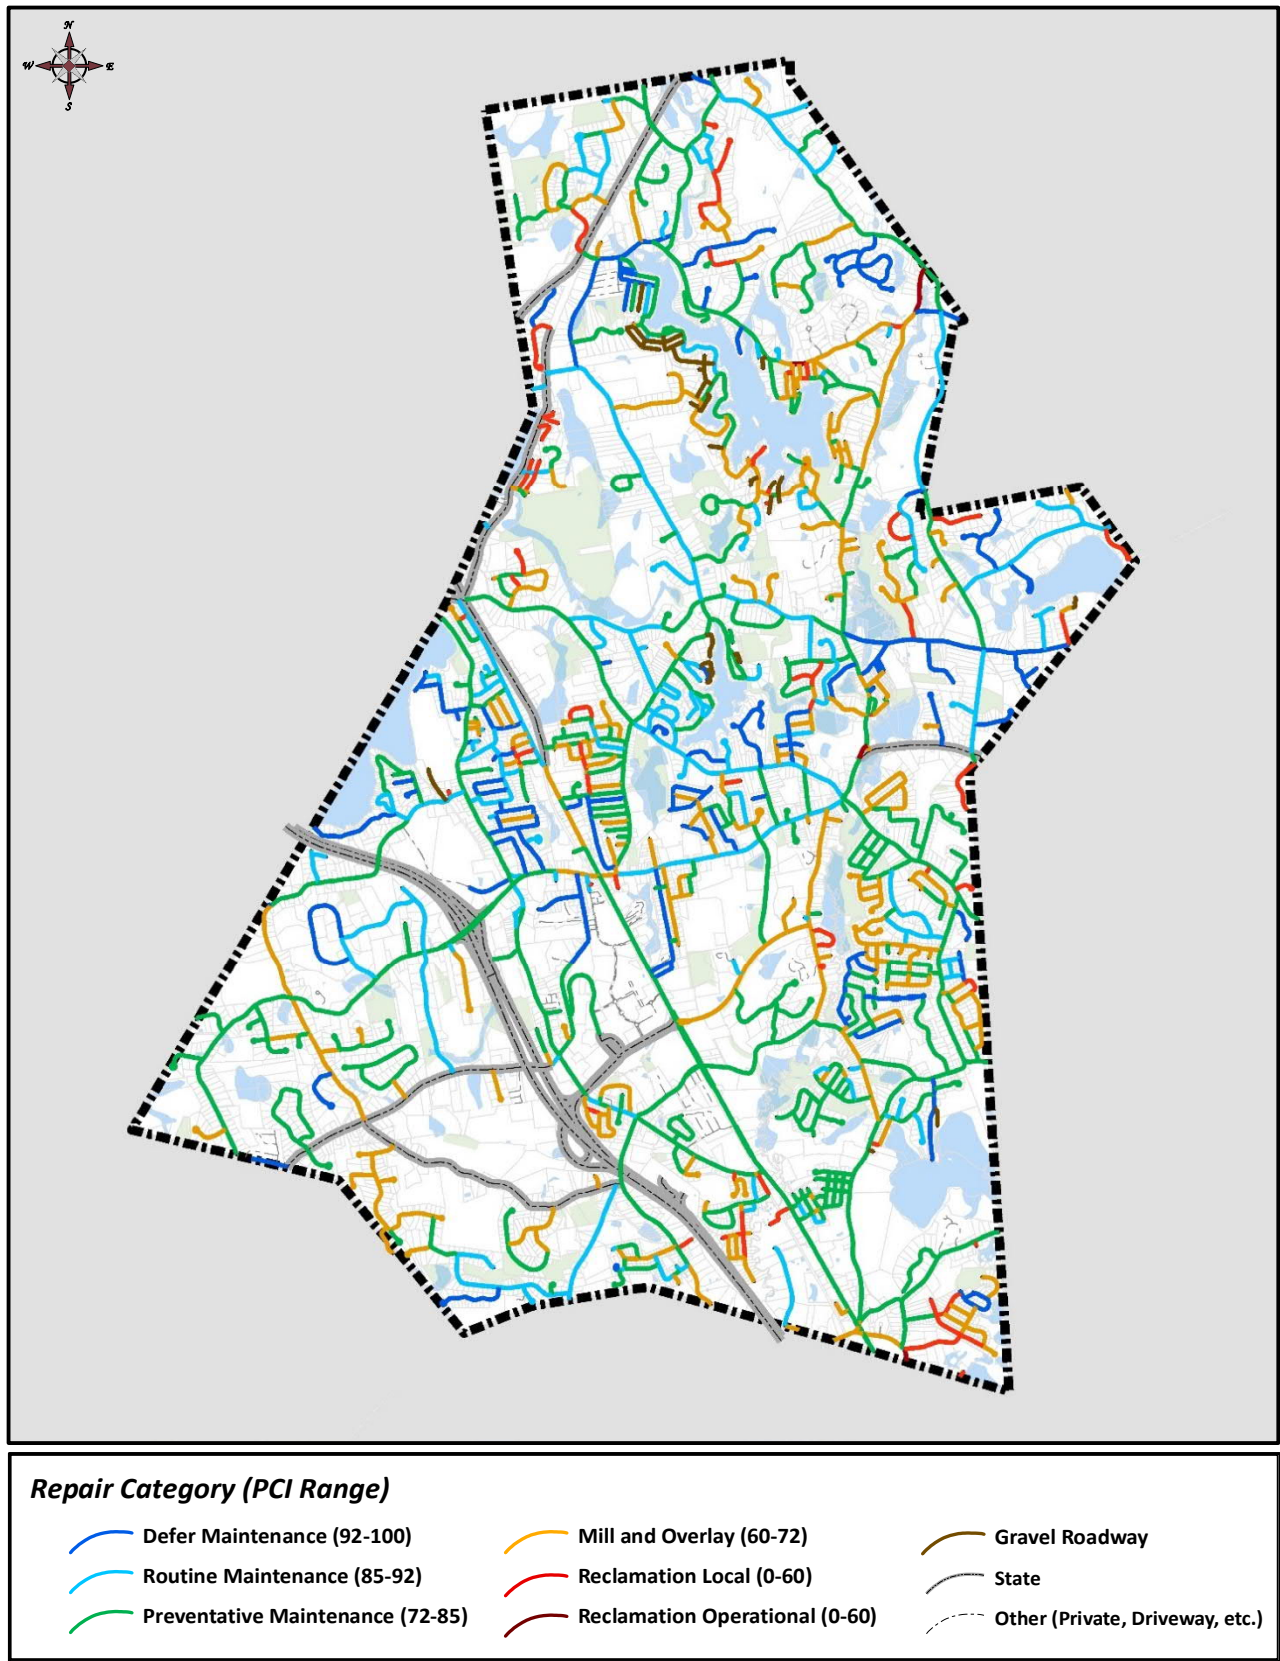

Figure 23: GIS graphic symbolizing all Town Maintained roadways by PCI range (By Road Segment)

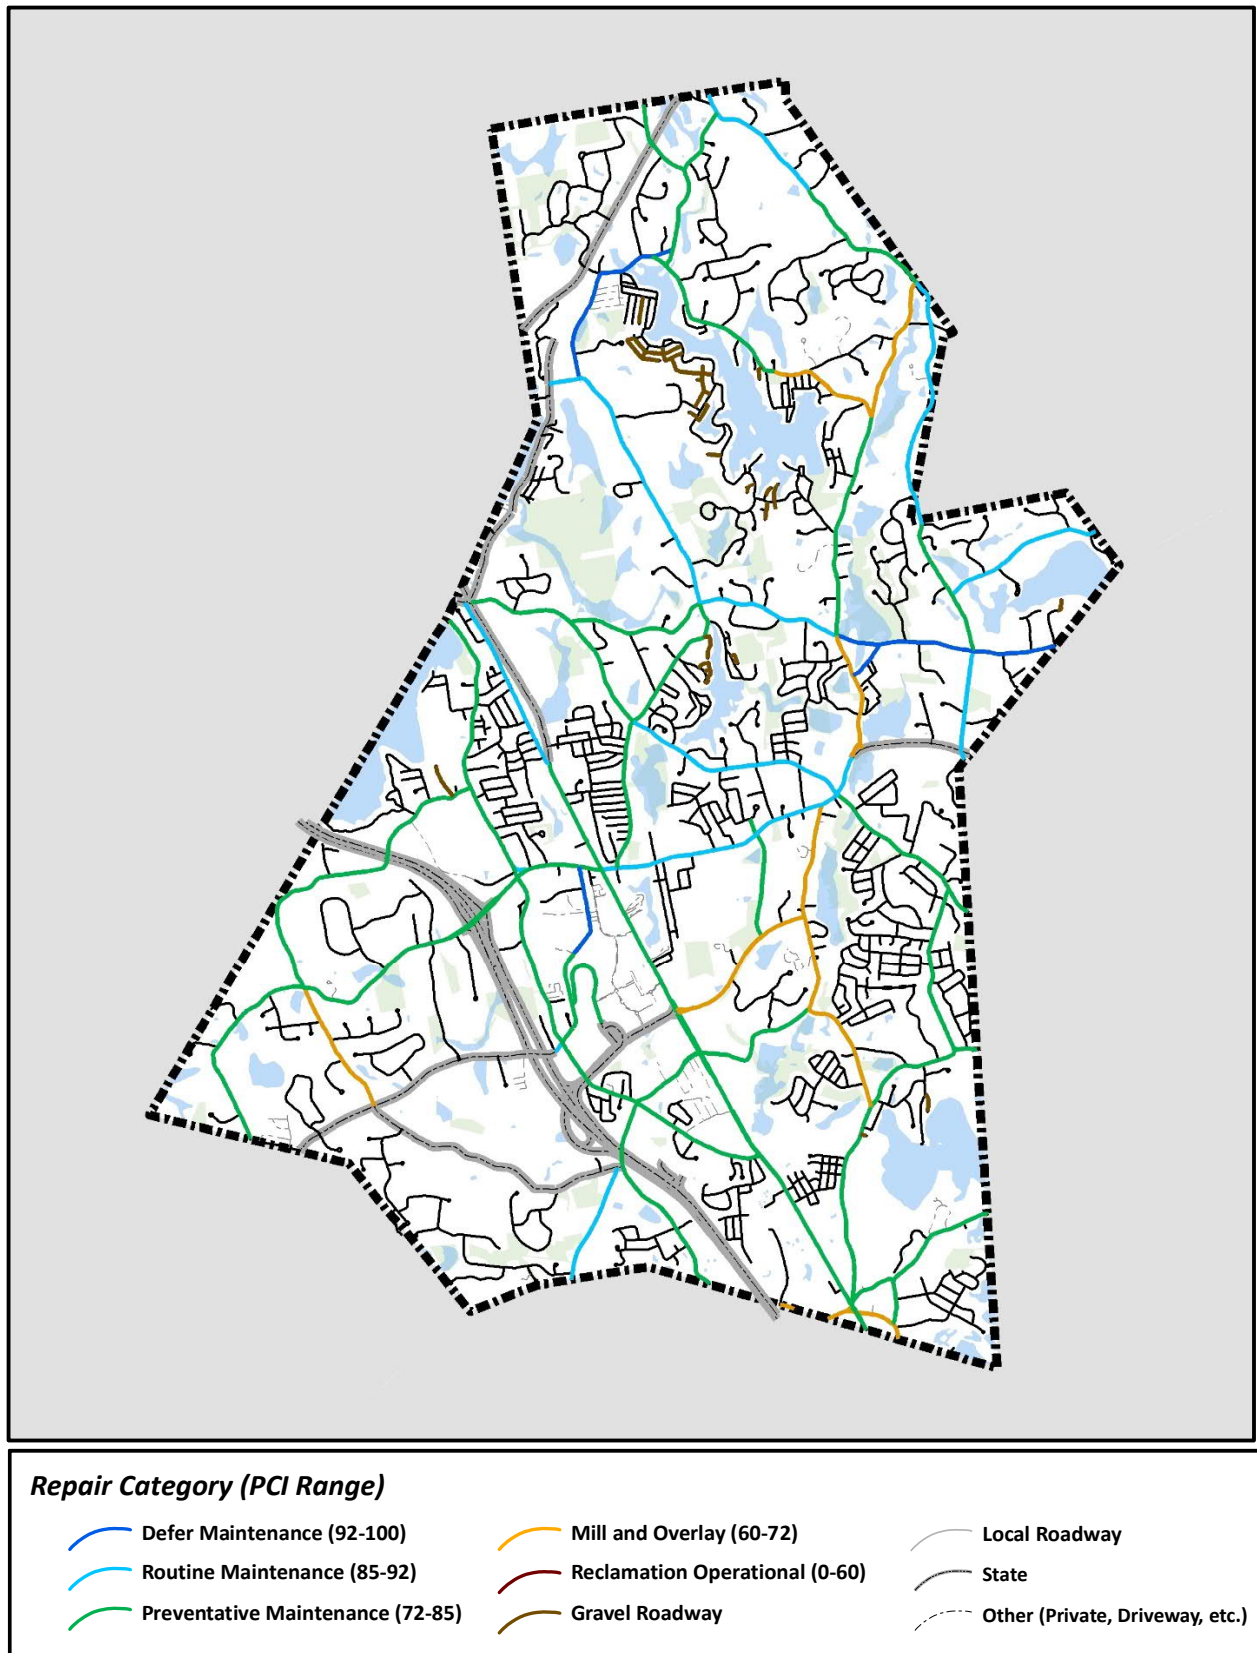

Figure 23: GIS graphic symbolizing all operational roadways by PCI range (Entire Road)

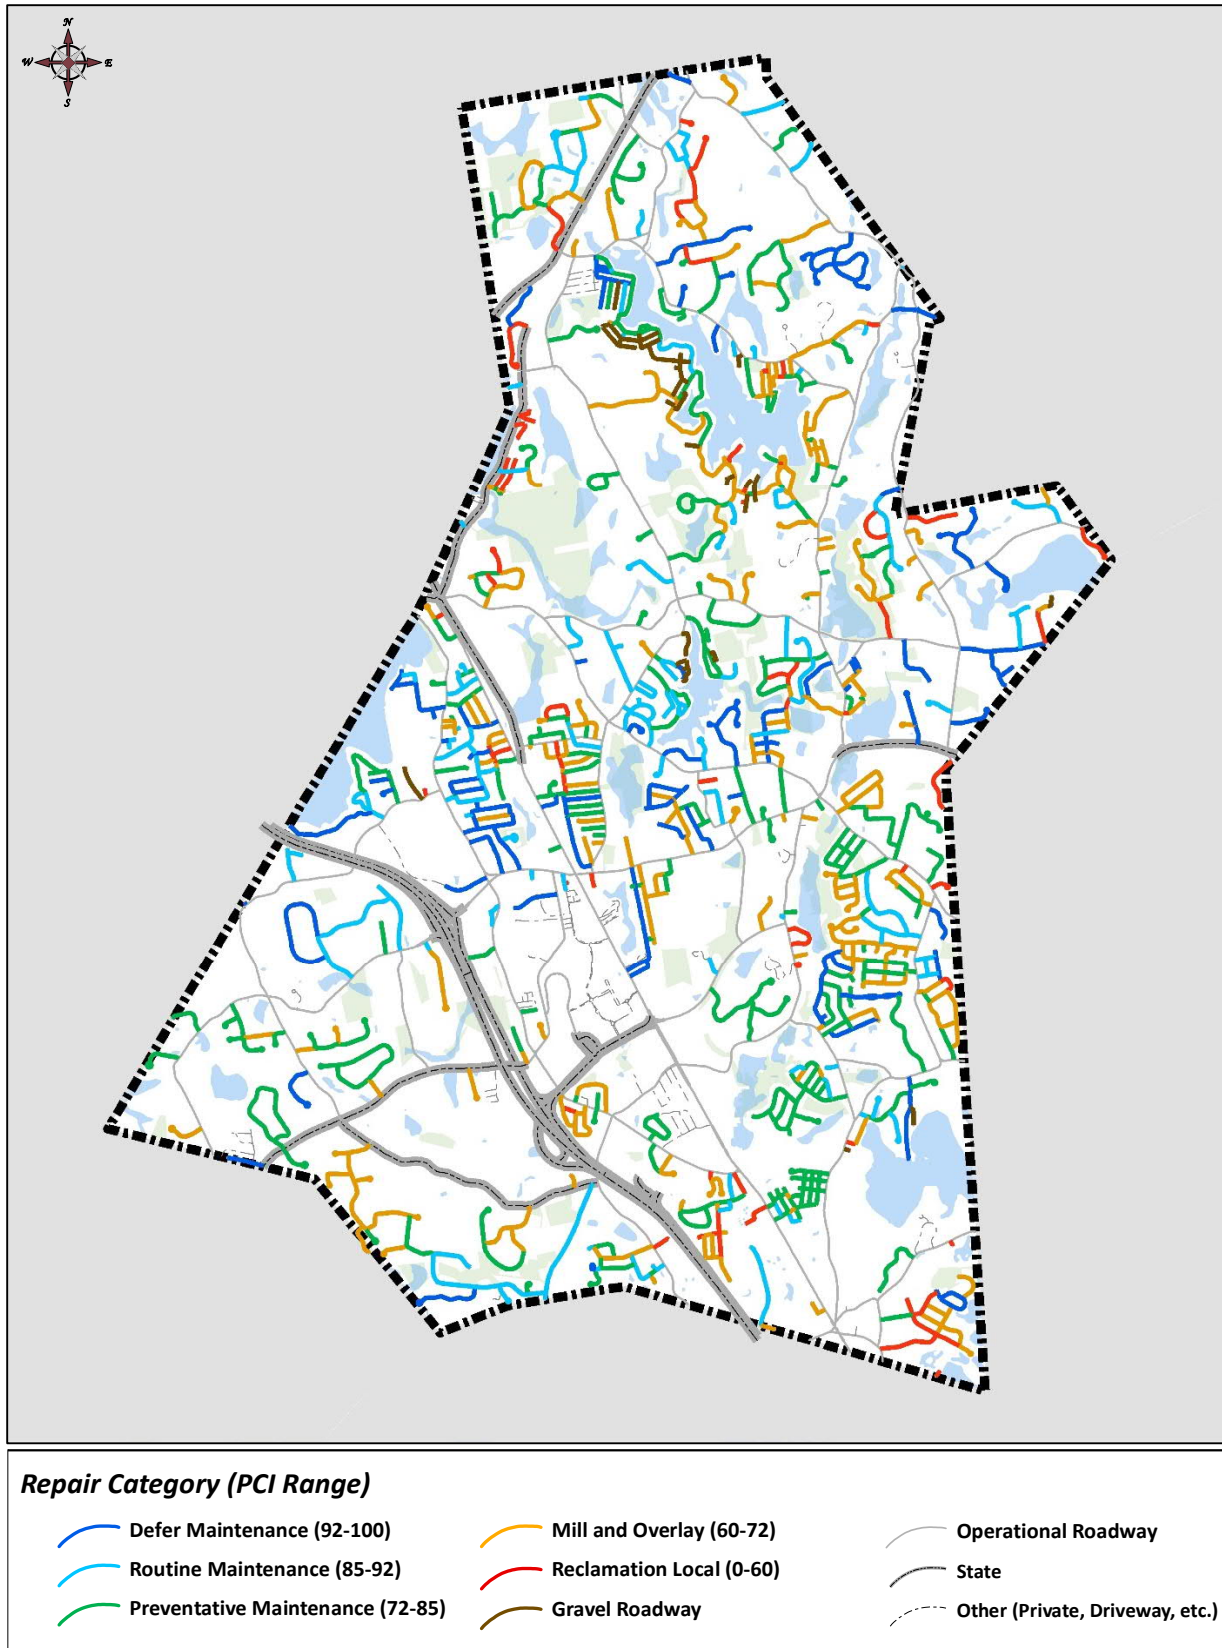

Figure 24: GIS graphic symbolizing all local roadways by PCI range (Entire Road)

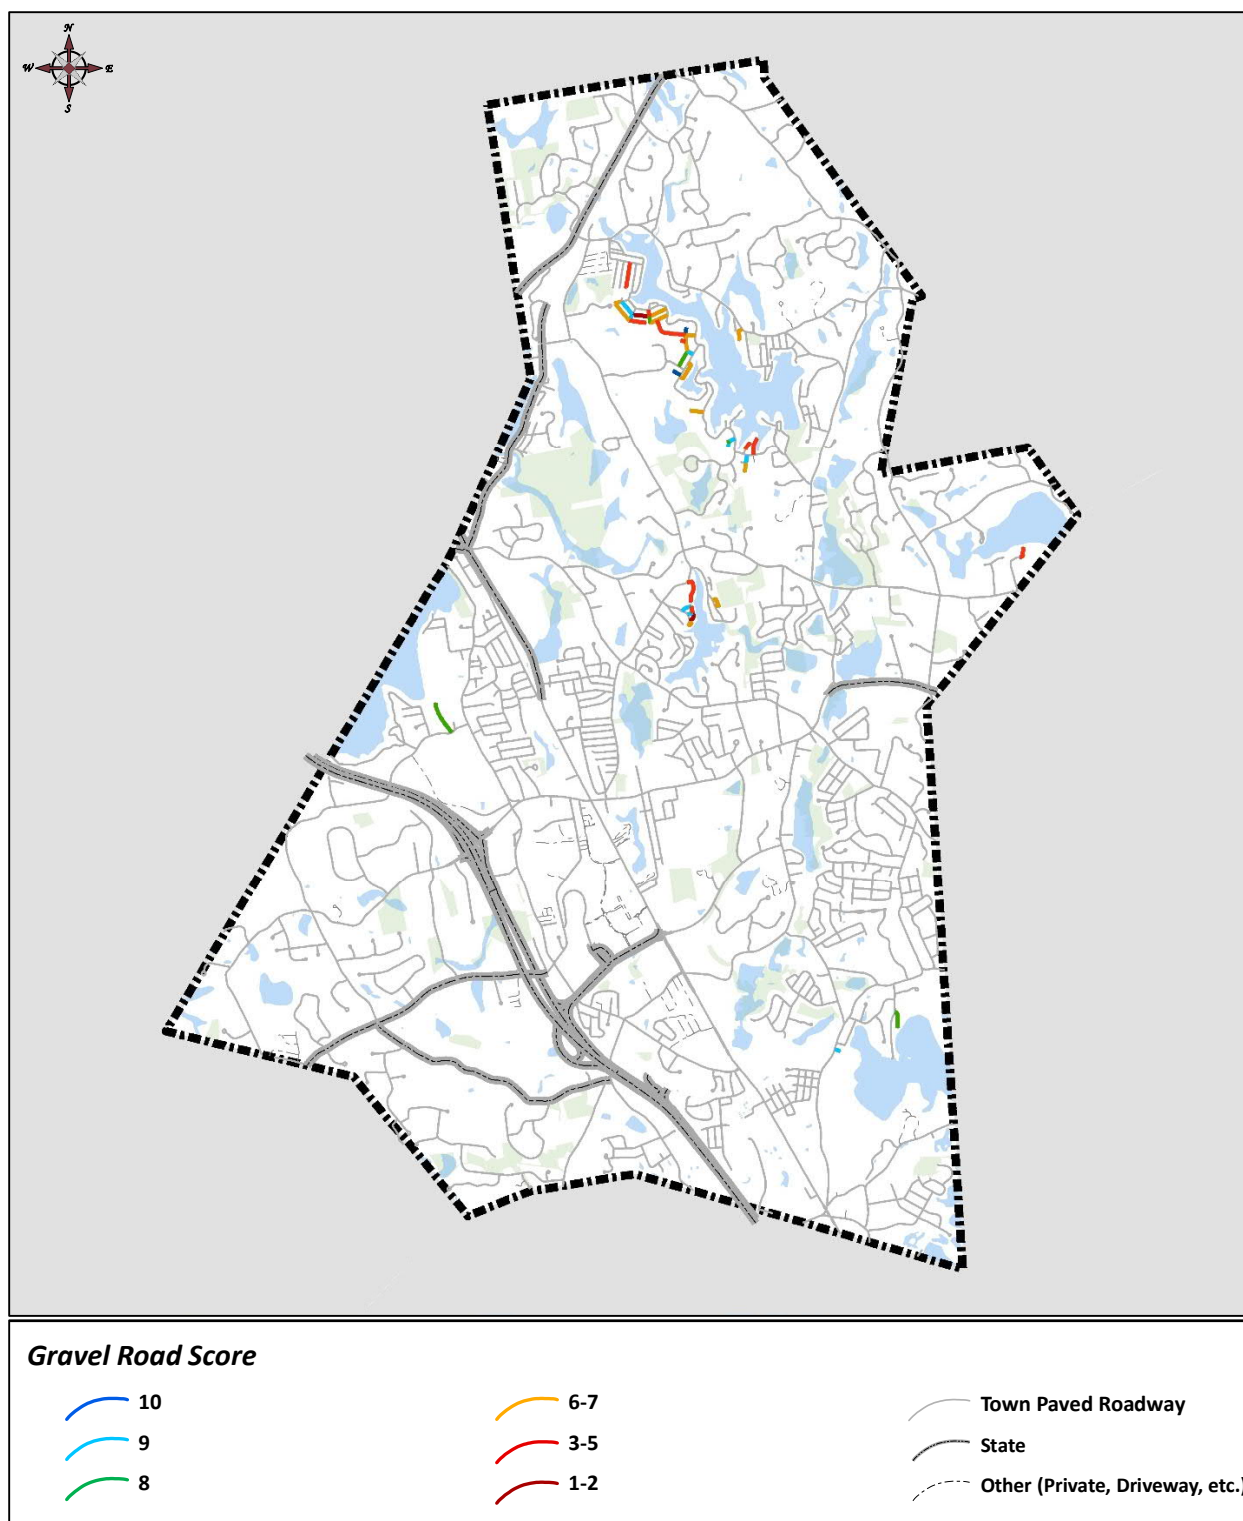

Figure 25: GIS graphic symbolizing all Town maintained gravel roads by condition score range (0-10 worst to best)

Capital Planning and PCI Forecasting

Each road segment within the PMP has been assigned a **Cost Benefit Value (CBV)**, a value calculated to serve as a tool to assist in prioritizing potential roadway improvement projects for inclusion in a multi-year **Capital Improvement Plan (CIP)**. The CBV is a standard formula utilized by Federal Highway that considers traffic volumes, unit cost of repair, life improvement of repair and PCI. This equation highlights cost effective maintenance that will ultimately save the Town money over time and aid in extending the lifecycle of roadways. The CBV serves as a guide in the development of a CIP that will assist the Town in improving its network rating over time.

CBV equation: *(Average Daily Traffic * Life Improvement of Repair)/(Current PCI*Unit Cost of Repair)*

For example, a CBV scoring near 100 is considered a high cost benefit value. This is likely due to a higher number of traffic volumes combined with a lower unit cost to improve the roadway. In general, arterial and collector roadways rated in the routine and preventative maintenance categories will score the highest CBV scores in the network due to higher traffic counts and lower costs to improve. Conversely, smaller cul de sac roadways with low PCI ratings generally score the lowest CBV scores, primarily due to the higher cost of improvement for roads with very low traffic counts.

A 5-year balanced forecast model (next page) was developed to demonstrate how the network-level PCI would likely adjust based on several different funding scenarios and repair strategies. Utilizing unit prices established working closely with Town staff, the model suggests that the Town allocate approximately \$5.25M annually moving forward to maintain the current rating. If the Town were to allocate \$8.0M annually, the Network PCI is projected to increase roughly 2.5-3 points in five years. On the other hand, if the \$4-\$4.5 Million that the Town is currently allocating to paving improvements were to continue, it is likely the network PCI would decline about 1 point over the next five years. This model can be customized based on repair treatments the Town plans to implement. The current model accounts for 3% annual inflation.

Please note, the assumed funding distribution is based on historical paving trends in the Town in conjunction with the current and projected future backlog.

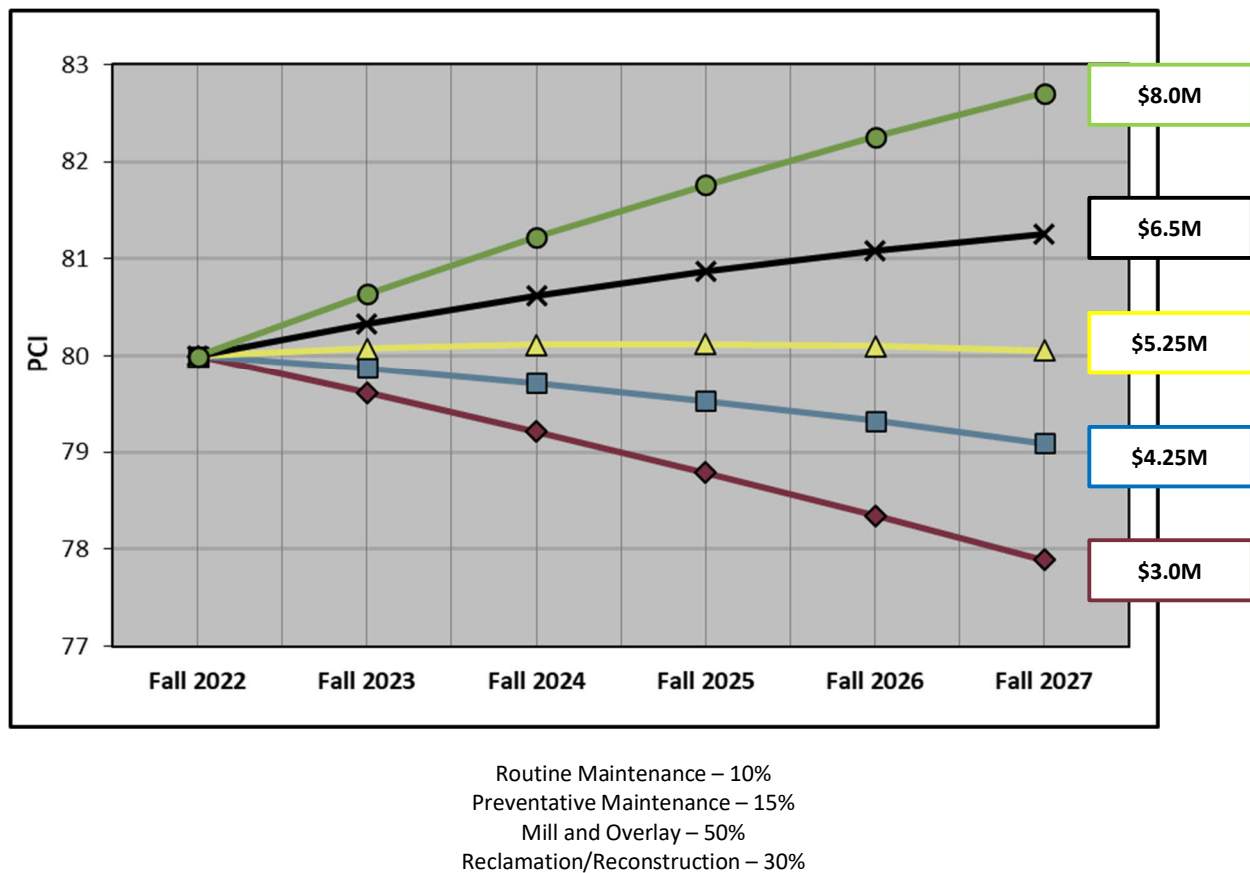

Figure 26: Five year balanced forecast model portrays the effects on the network PCI over time based on annual pavement maintenance spending

Based on the previous assessment conducted by the prior consultant in 2017, the recommended budget to maintain or slightly increase the network PCI was \$4.5 M. Today, BETA is recommending \$5.25M annually to keep the network PCI rating at or near an 80. This is primarily due to price volatility experienced in the economy over the past five years, especially recently as a direct result of the Covid 19 pandemic in 2020. This has resulted in steep price increases to asphalt, materials, and general labor due to supply chain issues, labor shortages, and a significant spike in inflation. 2023 bid results have already caused an almost 25% reduction in planned work. Therefore, due to the uncertainty of where prices will go in the future, BETA recommends increasing the Town's annual paving budget accordingly to, at a minimum, maintain the Town's PCI rating keep the roadway network in good condition.

Please note, where the Town considers reduced funding combined with significant inflation the resultant decline in road system will likely be sharper than shown in Figure 26.

Concluding Remarks and Next Steps

BETA conducted a pavement condition assessment of the Town's roadway network utilizing lidar based technology to update the Town's pavement management program. Comparing the network PCI to prior assessments, in general the overall rating has maintained its score of an 80 with minor fluctuations between inspections likely due to difference in inspection methodologies. However, to maintain this network rating, BETA is recommending a roughly 15% increase to the \$4.5M recommendation made in the prior assessment 5 years prior, primarily due to recent inflation.

The Town now has an updated snapshot of its roadway condition data to utilize to assist in prioritizing future roadway improvement project. As part of this project, the Town has access to all of the information in the form of tabular reports, a GIS based platform, and forward facing and 360 degree imagery. When utilizing the data to generate capital improvement plans, it is important to bear in mind that the PMP is a planning level tool and that other considerations may impact decision making such as sub surface utilities, sidewalks and curb ramps, and geographic implications.

To best manage and update the Town's PMP database, the following practices are suggested:

- *Post all annual roadway improvements into the database. Both the pavement condition rating and repair history information should be entered.*
- *Add any new roadway network descriptions to the database as soon as the Town accepts the roadways.*
- *Update repair method unit costs annually to provide accurate work plan forecasts.*
- *Assign one or more individuals to oversee system upkeep and to request annual pavement condition updates.*
- *Review developments in pavement technology that might offer a more cost-effective alternative to pavement maintenance or rehabilitation over the pavement's life cycle.*
- *Inspect the roadway network every 3-5 years to monitor progress*

The PMP will serve as a valuable instrument to the Town and facilitate a progressive approach to managing roadway infrastructure.

Appendix

Town of Salem, New Hampshire

Pavement Management Program

Appendix: Table of Contents

1. Repair Categories and Backlog Reports

- Roadway Status Summary
- Roadway Repair Categories and Banding
- Estimated Roadway Improvement Costs (By Entire Street)
- Estimated Roadway Improvement Costs (By Street Segment)
- Estimated Roadway Improvement Costs (Operational Roads, Entire Street)
- Estimated Roadway Improvement Costs (Local Roads, Entire Street)

2. Composite Pavement Condition Index (PCI) Summary Reports

- Sorted Alphabetically
- Sorted by Composite Pavement Condition Index (PCI)
- Sorted by Functional Classification

3. PCI Detailed Report

- Roadway Repairs with Segment Level Description

4. Cost Benefit Value (CBV) Reports

- CBV Analysis: Entire Roadways Sorted by CBV with Cumulative Total
- CBV Analysis Reports:
 - Reclamation
 - Mill and Overlay
 - Preventative Maintenance
 - Routine Maintenance

5. Gravel Roadway Inventory Reports

- Gravel Roadway Score Summary
- Gravel Roadway Inventory Report

Large Scale Map (see attached)

Pavement Condition Index Scores and Repair Categories Map – Entire Street (36"x48")

Pavement Condition Index Scores and Repair Categories Map – Street Segment (36"x48")

Salem, NH

Roadway Status Summary

Roadway Type	Length (Miles)
Status: Private
